TITLE OF THE INVENTION

## A METHOD OF TREATING CANCER

BACKGROUND OF THE INVENTION

5           The present invention relates to methods of treating cancer,  
and more particularly cancer associated with cells that produce prostate  
specific antigen (PSA), which comprise administering to a patient in  
need thereof at least one inhibitor of a prenyl-protein transferase and at  
least one conjugate, which comprises an oligopeptide that is selectively  
10       cleaved by PSA and a cytotoxic agent.

          In 1996 cancer of the prostate gland was expected to be  
diagnosed in 317,000 men in the U.S. and 42,000 American males die  
from this disease (Garnick, M.B. (1994). The Dilemmas of Prostate  
Cancer. Scientific American, April:72-81). Thus, prostate cancer is the  
15       most frequently diagnosed malignancy (other than that of the skin) in  
U.S. men and the second leading cause of cancer-related deaths (behind  
lung cancer) in that group.

          Prostate specific Antigen (PSA) is a single chain 33 kDa  
glycoprotein that is produced almost exclusively by the human prostate  
20       epithelium and occurs at levels of 0.5 to 2.0 mg/ml in human seminal  
fluid (Nadji, M., Taber, S.Z., Castro, A., et al. (1981) Cancer 48:1229;  
Papsidero, L., Kuriyama, M., Wang, M., et al. (1981). JNCI 66:37; Qui,  
S.D., Young, C.Y.F., Bihartz, D.L., et al. (1990), J. Urol. 144:1550; Wang,  
M.C., Valenzuela, L.A., Murphy, G.P., et al. (1979). Invest. Urol.  
25       17:159). The single carbohydrate unit is attached at asparagine residue  
number 45 and accounts for 2 to 3 kDa of the total molecular mass. PSA  
is a protease with chymotrypsin-like specificity (Christensson, A.,  
Laurell, C.B., Lilja, H. (1990). Eur. J. Biochem. 194:755-763). It has been  
shown that PSA is mainly responsible for dissolution of the gel structure  
30       formed at ejaculation by proteolysis of the major proteins in the sperm  
entrapping gel, Semenogelin I and Semenogelin II, and fibronectin  
(Lilja, H. (1985). J. Clin. Invest. 76:1899; Lilja, H., Oldbring, J.,  
Rannevik, G., et al. (1987). J. Clin. Invest. 80:281; McGee, R.S., Herr,  
J.C. (1988). Biol. Reprod. 39:499). The PSA mediated proteolysis of the  
35       gel-forming proteins generates several soluble Semenogelin I and

Semenogelin II fragments and soluble fibronectin fragments with liquefaction of the ejaculate and release of progressively motile spermatozoa (Lilja, H., Laurell, C.B. (1984). *Scand. J. Clin. Lab. Invest.* 44:447; McGee, R.S., Herr, J.C. (1987). *Biol. Reprod.* 37:431).

- 5 Furthermore, PSA may proteolytically degrade IGFBP-3 (insulin-like growth factor binding protein 3) allowing IGF to stimulate specifically the growth of PSA secreting cells (Cohen et al., (1992) *J. Clin. Endo. & Meta.* 75:1046-1053).

- PSA complexed to alpha 1 - antichymotrypsin is the
- 10 predominant molecular form of serum PSA and may account for up to 95% of the detected serum PSA (Christensson, A., Björk, T., Nilsson, O., et al. (1993). *J. Urol.* 150:100-105; Lilja, H., Christensson, A., Dahlén, U. (1991). *Clin. Chem.* 37:1618-1625; Stenman, U.H., Leinoven, J., Alfthan, H., et al. (1991). *Cancer Res.* 51:222-226). The prostatic tissue (normal,
- 15 benign hyperplastic, or malignant tissue) is implicated to predominantly release the mature, enzymatically active form of PSA, as this form is required for complex formation with alpha 1 - antichymotrypsin (Mast, A.E., Enghild, J.J., Pizzo, S.V., et al. (1991). *Biochemistry* 30:1723-1730; Perlmutter, D.H., Glover, G.I., Rivetna, M., et al. (1990). *Proc. Natl.*
- 20 *Acad. Sci. USA* 87:3753-3757). Therefore, in the microenvironment of prostatic PSA secreting cells the PSA is believed to be processed and secreted in its mature enzymatically active form not complexed to any inhibitory molecule. PSA also forms stable complexes with alpha 2 -
- 25 macroglobulin, but as this results in encapsulation of PSA and complete loss of the PSA epitopes, the in vivo significance of this complex formation is unclear. A free, noncomplexed form of PSA constitutes a minor fraction of the serum PSA (Christensson, A., Björk, T., Nilsson, O., et al. (1993). *J. Urol.* 150:100-105; Lilja, H., Christensson, A., Dahlén, U. (1991). *Clin. Chem.* 37:1618-1625). The size of this form of serum PSA
- 30 is similar to that of PSA in seminal fluid (Lilja, H., Christensson, A., Dahlén, U. (1991). *Clin. Chem.* 37:1618-1625) but it is yet unknown as to whether the free form of serum PSA may be a zymogen; an internally cleaved, inactive form of mature PSA; or PSA manifesting enzyme activity. However, it seems unlikely that the free form of serum PSA
- 35 manifests enzyme activity, since there is considerable (100 to 1000 fold)

molar excess of both unreacted alpha 1 - antichymotrypsin and alpha 2 -  
macroglobulin in serum as compared with the detected serum levels of  
the free 33 kDa form of PSA (Christensson, A., Björk, T., Nilsson, O., et  
al. (1993). J. Urol. 150:100-105; Lilja, H., Christensson, A., Dahlén, U.  
5 (1991). Clin. Chem. 37:1618-1625).

Serum measurements of PSA are useful for monitoring the  
treatment of adenocarcinoma of the prostate (Duffy, M.S. (1989). Ann.  
Clin. Biochem. 26:379-387; Brawer, M.K. and Lange, P.H. (1989). Urol.  
Suppl. 5:11-16; Hara, M. and Kimura, H. (1989). J. Lab. Clin. Med.  
10 113:541-548), although above normal serum concentrations of PSA have  
also been reported in benign prostatic hyperplasia and subsequent to  
surgical trauma of the prostate (Lilja, H., Christensson, A., Dahlén, U.  
(1991). Clin. Chem. 37:1618-1625). Prostate metastases are also known to  
secrete immunologically reactive PSA since serum PSA is detectable at  
15 high levels in prostatectomized patients showing widespread metastatic  
prostate cancer (Ford, T.F., Butcher, D.N., Masters, R.W., et al. (1985).  
Brit. J. Urology 57:50-55). Therefore, a cytotoxic compound that could be  
activated by the proteolytic activity of PSA should be prostate cell specific  
as well as specific for PSA secreting prostate metastases.

20 Conjugates which comprise an oligopeptide which can be  
selectively cleaved by enzymatically active PSA attached, either directly  
or via a linker to a cytotoxic agent and which are useful in the treatment  
of prostate cancer and benign prostatic hyperplasia have been previously  
described (U.S. Pat. No. 5,599,686 and 5,866,679).

25 Prenylation of proteins by intermediates of the isoprenoid  
biosynthetic pathway represents a class of post-translational  
modification (Glomset, J. A., Gelb, M. H., and Farnsworth, C. C. (1990).  
Trends Biochem. Sci. 15, 139-142; Maltese, W. A. (1990). FASEB J. 4,  
3319-3328). This modification typically is required for the membrane  
30 localization and function of these proteins. Prenylated proteins share  
characteristic C-terminal sequences including CaaX (C, Cys; a, usually  
aliphatic amino acid; X, another amino acid), XXCC, or XCXC. Three  
post-translational processing steps have been described for proteins  
having a C-terminal CaaX sequence: addition of either a 15 carbon  
35 (farnesyl) or 20 carbon (geranylgeranyl) isoprenoid to the Cys residue,

proteolytic cleavage of the last 3 amino acids, and methylation of the new C-terminal carboxylate (Cox, A. D. and Der, C. J. (1992a). *Critical Rev. Oncogenesis* 3:365-400; Newman, C. M. H. and Magee, A. I. (1993). *Biochim. Biophys. Acta* 1155:79-96). Some proteins may also have a

5 fourth modification: palmitoylation of one or two Cys residues N-terminal to the farnesylated Cys. While some mammalian cell proteins terminating in XCXC are carboxymethylated, it is not clear whether carboxy methylation follows prenylation of proteins terminating with a XXCC motif (Clarke, S. (1992). *Annu. Rev. Biochem.* 61, 355-386). For all

10 of the prenylated proteins, addition of the isoprenoid is the first step and is required for the subsequent steps (Cox, A. D. and Der, C. J. (1992a). *Critical Rev. Oncogenesis* 3:365-400; Cox, A. D. and Der, C. J. (1992b) *Current Opinion Cell Biol.* 4:1008-1016).

Three enzymes have been described that catalyze protein

15 prenylation: farnesyl-protein transferase (FPTase), geranylgeranyl-protein transferase type I (GGPTase-I), and geranylgeranyl-protein transferase type-II (GGPTase-II, also called Rab GGPTase). These enzymes are found in both yeast and mammalian cells (Clarke, 1992; Schafer, W. R. and Rine, J. (1992) *Annu. Rev. Genet.* 30:209-237). Each

20 of these enzymes selectively uses farnesyl diphosphate (FPP) or geranylgeranyl diphosphate as the isoprenoid donor and selectively recognizes the protein substrate. FPTase farnesylates CaaX-containing proteins that end with Ser, Met, Cys, Gln or Ala. For FPTase, CaaX tetrapeptides comprise the minimum region required for interaction of the

25 protein substrate with the enzyme. The enzymological characterization of these three enzymes has demonstrated that it is possible to selectively inhibit one with little inhibitory effect on the others (Moores, S. L., Schaber, M. D., Mosser, S. D., Rands, E., O'Hara, M. B., Garsky, V. M., Marshall, M. S., Pompliano, D. L., and Gibbs, J. B., *J. Biol. Chem.*,

30 266:17438 (1991), U.S. Pat. No. 5,470,832).

The Ras protein is part of a signalling pathway that links cell surface growth factor receptors to nuclear signals initiating cellular proliferation. Biological and biochemical studies of Ras action indicate that Ras functions like a G-regulatory protein. In the inactive state, Ras

35 is bound to GDP. Upon growth factor receptor activation, Ras is induced

to exchange GDP for GTP and undergoes a conformational change. The GTP-bound form of Ras propagates the growth stimulatory signal until the signal is terminated by the intrinsic GTPase activity of Ras, which returns the protein to its inactive GDP bound form (D.R. Lowy and D.M. Willumsen, *Ann. Rev. Biochem.* 62:851-891 (1993)). Activation of Ras leads to activation of multiple intracellular signal transduction pathways, including the MAP Kinase pathway and the Rho/Rac pathway (Joneson *et al.*, *Science* 271:810-812).

Inhibitors of farnesyl-protein transferase have been described in two general classes. The first class includes analogs of FPP, while the second is related to protein substrates (e.g., Ras) for the enzyme. The peptide derived inhibitors that have been described are generally cysteine containing molecules that are related to the CAAX motif that is the signal for protein prenylation. (Schaber *et al.*, *ibid*; Reiss *et al.*, *ibid*; Reiss *et al.*, *PNAS*, 88:732-736 (1991)). Such inhibitors may inhibit protein prenylation while serving as alternate substrates for the farnesyl-protein transferase enzyme, or may be purely competitive inhibitors (U.S. Patent 5,141,851, University of Texas; N.E. Kohl *et al.*, *Science*, 260:1934-1937 (1993); Graham, *et al.*, *J. Med. Chem.*, 37, 725 (1994)).

Numerous other classes of compounds have been described as inhibitors of a prenyl-protein transferase or in particular of farnesyl-protein transferase.

It is the object of the instant invention to provide a method for treating cancer, and more particularly cancer associated with cells that produce prostate specific antigen (PSA), which offers advantages over previously disclosed methods of treatment.

#### SUMMARY OF THE INVENTION

A method of treating cancer, and more particularly cancer associated with cells that produce prostate specific antigen (PSA), is disclosed which is comprised of administering to a patient in need of such treatment amounts of at least one inhibitor of a prenyl-protein transferase and at least one conjugate, which comprises an oligopeptide that is selectively cleaved by PSA and a cytotoxic agent.

## BRIEF DESCRIPTION OF THE FIGURES

FIGURE 1: *PSA Levels after Administration of a Combination of a PSA Conjugate and a Prenyl Protein Transferase Inhibitor*

#### DETAILED DESCRIPTION OF THE INVENTION

5           The present invention relates to a method of treating cancer, and more particularly cancer associated with cells that produce prostate specific antigen (PSA), which is comprised of administering to a patient in need of such treatment amounts of at least one inhibitor of a prenyl-protein transferase and at least one conjugate (hereinafter  
10 referred to as a PSA conjugate), which comprises an oligopeptide that is selectively cleaved by PSA and a cytotoxic agent.

          In practicing the instant method of treatment, it is understood that the inhibitor(s) of a prenyl protein transferase and the PSA conjugate(s) may be administered either simultaneously in a single  
15 pharmaceutical composition or individually in separate pharmaceutical compositions. If the inhibitor(s) of a prenyl protein transferase and the PSA conjugate(s) are administered in separate compositions, such compositions may be administered simultaneously or consecutively.

          The term "consecutively" when used in the context of  
20 administration of two or more separate pharmaceutical compositions means that administrations of the separate pharmaceutical compositions are at separate times. The term "consecutively" also includes administration of two or more separate pharmaceutical compositions wherein administration of one or more pharmaceutical  
25 compositions is a continuous administration over a prolonged period of time and wherein administration of another of the compositions occur at a discrete time during the prolonged period.

          The terms prenyl-protein transferase inhibitor and inhibitor of prenyl-protein transferase refer to compounds which  
30 antagonize, inhibit or counteract the expression of the gene coding a prenyl-protein transferase or the activity of the protein product thereof. Prenyl-protein transferases include farnesyl-protein transferase and geranylgeranyl-protein transferase type I.

          The terms farnesyl-protein transferase inhibitor and  
35 inhibitor of farnesyl-protein transferase likewise refer to compounds

which antagonize, inhibit or counteract the expression of the gene coding farnesyl-protein transferase or the activity of the protein product thereof.

5       The present invention is not limited in any way by the specific prenyl-protein transferase inhibitor. Either a protein substrate-competitive inhibitor and/or a prenyl pyrophosphate-competitive inhibitor now known or subsequently discovered or developed may be utilized. Prenyl-protein transferase inhibitors useful in the instant invention are described hereinbelow.

10       The term selective as used herein with respect to the inhibitors of a prenyl-protein transferase or farnesyl protein transferase refers to the inhibitory activity of the particular compound against prenyl-protein transferase activity. For example, a selective inhibitor of farnesyl-protein transferase exhibits at least 20 times greater activity  
15       against farnesyl-protein transferase when comparing its activity against another receptor or enzymatic activity, respectively. Preferably, if a selective inhibitor of farnesyl-protein transferase is desired, the selectivity is at least 100 times or more.

20       In an embodiment of the invention, the component of the instant composition which is the inhibitor of a prenyl-protein transferase is a selective inhibitor of farnesyl-protein transferase and is characterized by:

a)     an  $IC_{50}$  (a measurement of in vitro inhibitory activity) of less than about 500 nM against transfer of a farnesyl residue to a protein or  
25       peptide substrate comprising a  $CAAX^F$  motif by farnesyl-protein transferase.

It is more preferred that the selective inhibitor of farnesyl-protein transferase is characterized by:

a)     an  $IC_{50}$  (a measurement of in vitro inhibitory activity) of less than about 100 nM against transfer of a farnesyl residue to a protein or  
30       peptide substrate comprising a  $CAAX^F$  motif by farnesyl-protein transferase.

As used herein, the term " $CAAX^F$ " is used to designate a protein or peptide substrate that incorporates four amino acid C-

terminus motif that is farnesylated by farnesyl-protein transferase. In particular, such "CAAX<sup>F</sup>" motifs include (the corresponding human protein is in parentheses): CVLS (H-ras) (SEQ.ID.: 11), CVIM (K4B-Ras) (SEQ.ID.: 1), CVVM (N-Ras) (SEQ.ID.: 3), CKVL (RhoB) (SEQ.ID.: 9),  
5 CLIM (PFX) (SEQ.ID.: 10) and CNIQ (Rap2A) (SEQ.ID.: 13). It is understood that certain of the "CAAX<sup>F</sup>" containing protein or peptide substrates may also be geranylgeranylated by GGTase-I.

A method for measuring the activity of the inhibitors of prenyl-protein transferase utilized in the instant methods against  
10 transfer of a farnesyl residue to a protein or peptide substrate comprising a CAAX<sup>F</sup> motif by farnesyl-protein transferase is described in Example 35.

It is also preferred that the selective inhibitor of farnesyl-protein transferase is further characterized by:

- 15 b) an IC<sub>50</sub> (a measure of in vitro inhibitory activity) for inhibition of the prenylation of newly synthesized K-Ras protein more than about 100-fold higher than the IC<sub>50</sub> for the inhibition of the farnesylation of hDJ protein.

When measuring such IC<sub>50</sub>s the assays described in Examples 40 and  
20 41 may be utilized.

It is also preferred that the selective inhibitor of farnesyl-protein transferase is further characterized by:

- c) an IC<sub>50</sub> (a measurement of in vitro inhibitory activity) for inhibition of K4B-Ras dependent activation of MAP kinases in cells  
25 at least 100-fold greater than the IC<sub>50</sub> for inhibition of the farnesylation of the protein hDJ in cells.

It is also preferred that the selective inhibitor of farnesyl-protein transferase is further characterized by:

- d) an IC<sub>50</sub> (a measurement of in vitro inhibitory activity) against H-Ras dependent activation of MAP kinases in cells at least 1000 fold  
30 lower than the inhibitory activity (IC<sub>50</sub>) against H-ras-CVLL (SEQ.ID.NO.: 1) dependent activation of MAP kinases in cells.

When measuring Ras dependent activation of MAP kinases in cells the assays described in Example 39 may be utilized.

In another embodiment, the component of the instant composition which is an inhibitor of a prenyl-protein transferase utilized in the instant invention is efficacious in vivo as an inhibitor of both farnesyl-protein transferase and geranylgeranyl-protein transferase type I (GGTase-I). Preferably, such a dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I, which may be termed a Class II prenyl-protein transferase inhibitor, is characterized by:

- a) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) of less than about 1  $\mu M$  for inhibiting the transfer of a geranylgeranyl residue to a protein or peptide substrate comprising a  $CAAX^G$  motif by geranylgeranyl-protein transferase type I in the presence of a modulating anion; and
- b) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) of less than about 500 nM against transfer of a farnesyl residue to a protein or peptide substrate comprising a  $CAAX^F$  motif by farnesyl-protein transferase.

Preferably, such a Class II prenyl-protein transferase inhibitor is also characterized by:

- c) inhibition of the cellular prenylation of greater than (>) about 50% of the newly synthesized K4B-Ras protein after incubation of assay cells with the dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I at a concentration of less than (<) 10  $\mu M$ .

More preferably, such a Class II prenyl-protein transferase inhibitor is also characterized by:

- c) inhibition of the cellular prenylation of greater than (>) about 50% of the newly synthesized K4B-Ras protein after incubation of assay cells with the dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I at a concentration of less than (<) 5  $\mu M$ .

The term "CAAX<sup>G</sup>" will refer to such motifs that may be geranylgeranylated by GGTase-I. In particular, such "CAAX<sup>G</sup>" motifs include (the corresponding human protein is in parentheses): CVIM (K4B-Ras) (SEQ.ID.: 1), CVLL (mutated H-Ras) (SEQ.ID.: 2), CVVM (N-Ras) (SEQ.ID.: 3), CIIM (K4A-Ras) (SEQ.ID.: 4), CLLL (Rap-1A) (SEQ.ID.: 5), CQLL (Rap-1B) (SEQ.ID.: 6), CSIM (SEQ.ID.: 7), CAIM (SEQ.ID.: 8), CKVL (RhoB) (SEQ.ID.: 9), CLIM (PFX) (SEQ.ID.: 10) and CVIL (Rap2B) (SEQ.ID.: 12). Preferably, the CAAX motif is CVIM (SEQ.ID.: 1). It is understood that some of the "CAAX<sup>G</sup>" containing protein or peptide substrates may also be farnesylated by farnesyl-protein transferase.

The modulating anion may be selected from any type of molecule containing an anion moiety. Preferably the modulating anion is selected from a phosphate or sulfate containing anion. Particular examples of modulating anions useful in the instant GGTase-I inhibition assay include adenosine 5'-triphosphate (ATP), 2'-deoxyadenosine 5'-triphosphate (dATP), 2'-deoxycytosine 5'-triphosphate (dCTP), b-glycerol phosphate, pyrophosphate, guanosine 5'-triphosphate (GTP), 2'-deoxyguanosine 5'-triphosphate (dGTP), uridine 5'-triphosphate, dithiophosphate, 3'-deoxythymidine 5'-triphosphate, tripolyphosphate, D-myo-inositol 1,4,5-triphosphate, chloride, guanosine 5'-monophosphate, 2'-deoxyguanosine 5'-monophosphate, orthophosphate, formycin A, inosine diphosphate, trimetaphosphate, sulfate and the like. Preferably, the modulating anion is selected from adenosine 5'-triphosphate, 2'-deoxyadenosine 5'-triphosphate, 2'-deoxycytosine 5'-triphosphate, b-glycerol phosphate, pyrophosphate, guanosine 5'-triphosphate, 2'-deoxyguanosine 5'-triphosphate, uridine 5'-triphosphate, dithiophosphate, 3'-deoxythymidine 5'-triphosphate, tripolyphosphate, D-myo-inositol 1,4,5-triphosphate and sulfate. Most preferably, the modulating anion is selected from adenosine 5'-triphosphate, b-glycerol phosphate, pyrophosphate, dithiophosphate and sulfate.

A method for measuring the activity of the inhibitors of prenyl-protein transferase utilized in the instant methods against

transfer of a geranylgeranyl residue to protein or peptide substrate comprising a CAAX<sup>G</sup> motif by geranylgeranyl-protein transferase type I in the presence of a modulating anion is described in Example 36.

5 Examples of assay cells that may be utilized to determine inhibition of cellular processing of newly synthesized protein that is a substrate of an enzyme that can modify the K4B-Ras protein C-terminus include 3T3, C33a, PSN-1 (a human pancreatic carcinoma cell line) and K-ras-transformed Rat-1 cells. Preferred assay cell line has been found to be PSN-1. The preferred newly synthesized protein,  
10 whose percentage of processing is assessed in this assay, is selected from K4B-Ras and Rap1.

A method for measuring the activity of the inhibitors of prenyl-protein transferase, as well as the instant combination compositions, utilized in the instant methods against the cellular  
15 processing of newly synthesized protein that is a substrate of an enzyme that can modify the K4B-Ras protein C-terminus after incubation of assay cells with the compound of the invention transferase is described in Example 40 and 41.

A Class II prenyl-protein transferase inhibitor may also be  
20 characterized by:

- a) an IC<sub>50</sub> (a measurement of in vitro inhibitory activity) for inhibiting K4B-Ras dependent activation of MAP kinases in cells of less than 5  $\mu$ M.

A Class II prenyl-protein transferase inhibitor may also be  
25 characterized by:

- a) an IC<sub>50</sub> (a measurement of in vitro inhibitory activity) for inhibiting K4B-Ras dependent activation of MAP kinases in cells between 0.1 and 100 times the IC<sub>50</sub> for inhibiting the farnesylation of the protein hDJ in cells; and  
30 b) an IC<sub>50</sub> (a measurement of in vitro inhibitory activity) for inhibiting K4B-Ras dependent activation of MAP kinases in cells greater than 5-fold lower than the inhibitory activity (IC<sub>50</sub>) against expression of the SEAP protein in cells transfected with the

pCMV-SEAP plasmid that constitutively expresses the SEAP protein.

A Class II prenyl-protein transferase inhibitor may also be characterized by:

- 5 a) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) against H-Ras dependent activation of MAP kinases in cells greater than 2 fold lower but less than 20,000 fold lower than the inhibitory activity ( $IC_{50}$ ) against H-ras-CVLL (SEQ.ID.NO.: 1) dependent activation of MAP kinases in cells; and
- 10 b) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) against H-ras-CVLL dependent activation of MAP kinases in cells greater than 5-fold lower than the inhibitory activity ( $IC_{50}$ ) against expression of the SEAP protein in cells transfected with the pCMV-SEAP plasmid that constitutively expresses the SEAP
- 15 protein.

A Class II prenyl-protein transferase inhibitor may also be characterized by:

- a) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) against H-Ras dependent activation of MAP kinases in cells greater than
- 20 10-fold lower but less than 2,500 fold lower than the inhibitory activity ( $IC_{50}$ ) against H-ras-CVLL (SEQ.ID.NO.: 1) dependent activation of MAP kinases in cells; and
- b) an  $IC_{50}$  (a measurement of in vitro inhibitory activity) against
- 25 H-ras-CVLL dependent activation of MAP kinases in cells greater than 5 fold lower than the inhibitory activity ( $IC_{50}$ ) against expression of the SEAP protein in cells transfected with the pCMV-SEAP plasmid that constitutively expresses the SEAP
- protein.

- 30 In a third embodiment, the prenyl-protein transferase inhibitors useful in the instantly claimed methods are dual inhibitors of farnesyl-protein transferase and geranylgeranyl-protein transferase type I (GGTase-I) and are further characterized in that the inhibitory activity of the compounds against GGTase-I is greater than the inhibitory activity against FPTase. Such dual inhibitor compounds

having greater activity against GGTase type I may be termed Class III prenyl protein transferase inhibitors. Preferably, such Class III prenyl protein transferase inhibitors inhibit FPTase in vitro (Example 35) at an  $IC_{50}$  of less than 1  $\mu M$  and inhibit GGTase-I in vitro (Example 36) at an  $IC_{50}$  of less than 50 nM. Also preferably, the compounds of this embodiment of the instant invention inhibit the cellular processing of the Rap1 protein (Example 42) at an  $EC_{50}$  of less than 50 nM. Also more preferably, the ratio of the  $IC_{50}$  of the compounds of this embodiment of the instant invention for in vitro inhibition of FPTase to the  $IC_{50}$  of the compounds of the instant invention for in vitro inhibition of GGTase type I is greater than 25.

The composition useful in the instant method of treatment also comprises a PSA conjugate. The PSA conjugate comprises an oligopeptide, which is specifically recognized by the free prostate specific antigen (PSA) and are capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, covalently bonded directly, or through a chemical linker, to a cytotoxic agent. Ideally, the cytotoxic activity of the cytotoxic agent is greatly reduced or absent when the oligopeptide containing the PSA proteolytic cleavage site is bonded directly, or through a chemical linker, to the cytotoxic agent and is intact. Also ideally, the cytotoxic activity of the cytotoxic agent increases significantly or returns to the activity of the unmodified cytotoxic agent upon proteolytic cleavage of the attached oligopeptide at the cleavage site. While it is not necessary for practicing this aspect of the invention, a preferred embodiment of this aspect of the invention is a conjugate wherein the oligopeptide, and the chemical linker if present, are detached from the cytotoxic agent by the proteolytic activity of the free PSA and any other native proteolytic enzymes present in the tissue proximity, thereby releasing unmodified cytotoxic agent into the physiological environment at the place of proteolytic cleavage. Pharmaceutically acceptable salts of the conjugates are also included.

Oligopeptides that are selectively cleaved by enzymatically active PSA can be identified by a number of assays, in particularly the assays described in Examples 43-46 and 48.

In one embodiment of the instant invention, the oligopeptide component of the PSA conjugate incorporates a cyclic amino acid having a hydrophilic substituent as part of the oligopeptides, said cyclic amino acid which contributes to the aqueous solubility of the conjugate.

- 5 Examples of such hydrophilic cyclic amino acids include but are not limited to hydroxylated, polyhydroxylated and alkoxylated proline and pipercolic acid moieties.

- In a preferred embodiment of the invention the oligopeptide component of the PSA conjugate is characterized by having a protecting group on the terminus amino acid moiety that is not attached to the  
10 cytotoxic agent. Such protection of the terminal amino acid reduces or eliminates the enzymatic degradation of such peptidyl therapeutic agents by the action of exogenous aminopeptidases and carboxypeptidases which are present in the blood plasma of warm  
15 blooded animals. Examples of protecting groups that may be attached to the amino moiety of an N-terminus oligopeptide include, but are not limited to acetyl, benzoyl, pivaloyl, succinyl, glutaryl, hydroxyalkanoyl, polyhydroxyalkanoyl, polyethylene glycol (PEG) containing alkanoyl and the like. Examples of protecting groups that may be attached to the  
20 carboxylic acid of a C-terminus oligopeptide include, but are not limited to, formation of an organic or inorganic ester of the carboxylic acid, such as an alkyl, aralkyl, aryl, polyether ester, phosphoryl and sulfonyl, or conversion of the carboxylic acid moiety to a substituted or unsubstituted amide moiety. The N-terminus or C-terminus of the oligopeptide may  
25 also be substituted with a unnatural amino acid, such as  $\beta$ -alanine, or a D-amino acid, such as a D-valyl or D-alanyl group.

- It is understood that the oligopeptide which is conjugated to the cytotoxic agent, whether through a direct covalent bond or through a chemical linker, does not need to be the oligopeptide that has the greatest  
30 recognition by free PSA and is most readily proteolytically cleaved by free PSA. Thus, the oligopeptide that is selected for incorporation in such conjugate will be chosen both for its selective, proteolytic cleavage by free PSA and for the cytotoxic activity of the cytotoxic agent-proteolytic residue conjugate (or, in what is felt to be an ideal situation, the  
35 unmodified cytotoxic agent) which results from such a cleavage.

Because the PSA conjugates useful in the instant compositions can be used for modifying a given biological response, cytotoxic agent component of the PSA conjugate is not to be construed as limited to classical chemical therapeutic agents. For example, the

5 cytotoxic agent may be a protein or polypeptide possessing a desired biological activity. Such proteins may include, for example, a toxin such as abrin, ricin A, pseudomonas exotoxin, or diphtheria toxin; a protein such as tumor necrosis factor, a-interferon, b-interferon, nerve growth factor, platelet derived growth factor, tissue plasminogen activator; or,

10 biological response modifiers such as, for example, lymphokines, interleukin-1 ("IL-1"), interleukin-2 ("IL-2"), interleukin-6 ("IL-6"), granulocyte macrophage colony stimulating factor ("GM-CSF"), granulocyte colony stimulating factor ("G-CSF"), or other growth factors.

15 The preferred cytotoxic agents include, in general, alkylating agents, antiproliferative agents, tubulin binding agents and the like. Preferred classes of cytotoxic agents include, for example, the anthracycline family of drugs, the vinca drugs, the mitomycins, the bleomycins, the cytotoxic nucleosides, the pteridine family of drugs,

20 diynenes, and the podophyllotoxins. Particularly useful members of those classes include, for example, doxorubicin, carminomycin, daunorubicin, aminopterin, methotrexate, methopterin, dichloromethotrexate, mitomycin C, porfiromycin, 5-fluorouracil, 6-mercaptopurine, cytosine arabinoside, podophyllotoxin, or podophyllotoxin derivatives such as etoposide or etoposide phosphate,

25 melphalan, vinblastine, vincristine, leurosidine, vindesine, leurosine and the like. Other useful cytotoxic agents include estramustine, cisplatin and cyclophosphamide. One skilled in the art may make chemical modifications to the desired cytotoxic agent in order to make

30 reactions of that compound more convenient for purposes of preparing PSA conjugates of the invention.

Preferably the cytotoxic agent component of the PSA conjugate is selected from a member of a class of cytotoxic agents selected from the vinca alkaloid drugs and the anthracyclines.

A pharmaceutical composition which is useful for the treatments of the instant invention may comprise one or more inhibitors of prenyl-protein transferase, one or more PSA conjugates, or a combination thereof, preferably, in combination with pharmaceutically acceptable carriers, excipients or diluents, according to standard pharmaceutical practice. The composition may be administered to mammals, preferably humans. The composition can be administered orally or parenterally, including the intravenous, intramuscular, intraperitoneal, subcutaneous, rectal and topical routes of administration.

The pharmaceutical compositions containing the active ingredients may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, microcrystalline cellulose, sodium crosscarmellose, corn starch, or alginic acid; binding agents, for example starch, gelatin, polyvinylpyrrolidone or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to mask the unpleasant taste of the drug or delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a water soluble taste masking material such as hydroxypropylmethylcellulose or hydroxypropylcellulose, or a time delay material such as ethyl cellulose, cellulose acetate butyrate may be employed.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed  
5 with water soluble carrier such as polyethyleneglycol or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example  
10 sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or  
15 condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethylene-oxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or  
condensation products of ethylene oxide with partial esters derived from  
20 fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

25 Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth  
30 above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as butylated hydroxyanisol or alpha-tocopherol.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active  
35 ingredient in admixture with a dispersing or wetting agent, suspending

agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

The pharmaceutical compositions useful in the instant methods of treatment may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example soy bean lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring agents, preservatives and antioxidants.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative, flavoring and coloring agents and antioxidant.

The pharmaceutical compositions may be in the form of a sterile injectable aqueous solutions. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution.

The sterile injectable preparation may also be a sterile injectable oil-in-water microemulsion where the active ingredient is dissolved in the oily phase. For example, the active ingredient may be first dissolved in a mixture of soybean oil and lecithin. The oil solution then introduced into a water and glycerol mixture and processed to form a microemulation.

The injectable solutions or microemulsions may be introduced into a patient's blood-stream by local bolus injection. Alternatively, it may be advantageous to administer the solution or microemulsion in such a way as to maintain a constant circulating

concentration of the instant compound. In order to maintain such a constant concentration, a continuous intravenous delivery device may be utilized. An example of such a device is the Deltec CADD-PLUS™ model 5400 intravenous pump.

5           The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension for intramuscular and subcutaneous administration. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The  
10       sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For  
15       this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

          The instant compositions may also be administered in the form of a suppositories for rectal administration of the drug. These  
20       compositions can be prepared by mixing the instant composition with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the composition. Such materials include cocoa butter, glycerinated gelatin, hydrogenated vegetable oils, mixtures of  
25       polyethylene glycols of various molecular weights and fatty acid esters of polyethylene glycol.

          For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the combination of inhibitor(s) of prenyl-protein transferase and PSA conjugate(s) are employed. (For purposes  
30       of this application, topical application shall include mouth washes and gargles.)

          The compositions useful in the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles and delivery devices, or via transdermal routes, using those  
35       forms of transdermal skin patches well known to those of ordinary skill in the art. To be administered in the form of a transdermal delivery

system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specific amounts, as well as any product which results, directly or indirectly, from combination of the specific ingredients in the specified amounts.

The composition of a prenyl-protein transferase inhibitor(s), a PSA conjugate(s), or a combination thereof useful in the instant methods of treatment may also be co-administered with other well known therapeutic agents that are selected for their particular usefulness against the condition that is being treated.

The instant method of treatment may also be combined with surgical treatment (such as surgical removal of tumor and/or prostatic tissue) where appropriate.

If formulated as a fixed dose, the compositions useful in the instant invention employ the prenyl-protein transferase inhibitor(s) and the PSA conjugate(s) within within the dosage ranges described below.

When compositions according to this invention are administered into a human subject, the daily dosage will normally be determined by the prescribing physician with the dosage generally varying according to the age, weight, and response of the individual patient, as well as the severity of the patient's symptoms.

In one exemplary application, a suitable amount of an inhibitor of prenyl-protein transferase and a suitable amount of a PSA conjugate are administered to a mammal undergoing treatment for prostate cancer. Administration occurs in an amount of prenyl-protein transferase inhibitor of between about  $2 \text{ mg/m}^2$  of body surface area to about  $2 \text{ g/m}^2$  of body surface area per day, preferably between about  $12 \text{ mg/m}^2$  of body surface area to about  $1200 \text{ mg/m}^2$  of body surface area per day, if the prenyl-protein transferase inhibitor is administered continuously over a 7 day period. A particular daily therapeutic dosage that comprises the instant composition includes from about 10 mg to about 3000 mg of an inhibitor of prenyl-protein transferase. Preferably, the daily dosage comprises from about 20 mg to about 2000 mg of an

inhibitor of prenyl-protein transferase. A higher dosage of the prenyl-protein transferase inhibitor may be administered if the inhibitor is administered in a single dose once a week. Administration of the PSA conjugate occurs in an amount between about 10 mg/m<sup>2</sup> of body surface area to about 5 g/m<sup>2</sup> of body surface area per day, preferably between about 50 mg/m<sup>2</sup> of body surface area to about 3 g/m<sup>2</sup> of body surface area per day.

The instant method of treatment may also be combined with administration of a compound which inhibits HMG-CoA reductase in the methods of treatment of the instant invention. Compounds which have inhibitory activity for HMG-CoA reductase can be readily identified by using assays well-known in the art. For example, see the assays described or cited in U.S. Patent 4,231,938 at col. 6, and WO 84/02131 at pp. 30-33. The terms "HMG-CoA reductase inhibitor" and "inhibitor of HMG-CoA reductase" have the same meaning when used herein.

Examples of HMG-CoA reductase inhibitors that may be used include but are not limited to lovastatin (MEVACOR®; see US Patent Nos. 4,231,938; 4,294,926; 4,319,039), simvastatin (ZOCOR®; see US Patent Nos. 4,444,784; 4,820,850; 4,916,239), pravastatin (PRAVACHOL®; see US Patent Nos. 4,346,227; 4,537,859; 4,410,629; 5,030,447 and 5,180,589), fluvastatin (LESCOL®; see US Patent Nos. 5,354,772; 4,911,165; 4,929,437; 5,189,164; 5,118,853; 5,290,946; 5,356,896), atorvastatin (LIPITOR®; see US Patent Nos. 5,273,995; 4,681,893; 5,489,691; 5,342,952) and cerivastatin (also known as rivastatin and BAYCHOL®; see US Patent No. 5,177,080). The structural formulas of these and additional HMG-CoA reductase inhibitors that may be used in the instant methods are described at page 87 of M. Yalpani, "Cholesterol Lowering Drugs", *Chemistry & Industry*, pp. 85-89 (5 February 1996) and US Patent Nos. 4,782,084 and 4,885,314. The term HMG-CoA reductase inhibitor as used herein includes all pharmaceutically acceptable lactone and open-acid forms (i.e., where the lactone ring is opened to form the free acid) as well as salt and ester forms of compounds which have HMG-CoA reductase inhibitory activity, and therefor the use of such salts, esters, open-acid and lactone forms is included within the

scope of this invention. An illustration of the lactone portion and its corresponding open-acid form is shown below as structures I and II.

5

In HMG-CoA reductase inhibitor's where an open-acid form can exist, salt and ester forms may preferably be formed from the open-acid, and all such forms are included within the meaning of the term "HMG-CoA reductase inhibitor" as used herein. Preferably, the HMG-CoA reductase inhibitor is selected from lovastatin and simvastatin, and most preferably simvastatin. Herein, the term "pharmaceutically acceptable salts" with respect to the HMG-CoA reductase inhibitor shall mean non-toxic salts of the compounds employed in this invention which are generally prepared by reacting the free acid with a suitable organic or inorganic base, particularly those formed from cations such as sodium, potassium, aluminum, calcium, lithium, magnesium, zinc and tetramethylammonium, as well as those salts formed from amines such as ammonia, ethylenediamine, N-methylglucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chloroprocaine, diethanolamine, procaine, N-benzylphenethylamine, 1-p-chlorobenzyl-2-pyrrolidine-1'-yl-methylbenzimidazole, diethylamine, piperazine, and tris(hydroxymethyl)aminomethane. Further examples of salt forms of HMG-CoA reductase inhibitors may include, but are not limited to, acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate, bromide, calcium edetate, camsylate, carbonate, chloride, clavulanate, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, hydrobromide,

25

hydrochloride, hydroxynapthoate, iodide, isothionate, lactate, lactobionate, laurate, malate, maleate, mandelate, mesylate, methylsulfate, mucate, napsylate, nitrate, oleate, oxalate, pamaote, palmitate, panthothenate, phosphate/diphosphate, polygalacturonate, salicylate, stearate, subacetate, succinate, tannate, tartrate, teoclate, tosylate, triethiodide, and valerate.

Ester derivatives of the described HMG-CoA reductase inhibitor compounds may act as prodrugs which, when absorbed into the bloodstream of a warm-blooded animal, may cleave in such a manner as to release the drug form and permit the drug to afford improved therapeutic efficacy.

The instant method of treatment may be combined with administration of a compound which inhibits a fibroblast growth factor (FGF) receptor function in the methods of treatment of the instant invention. The instant method of treatment may be combined with administration of a compound which inhibits a urokinase in the methods of treatment of the instant invention.

The instant method of treatment may be combined with administration of a compound which inhibits angiogenesis, and thereby inhibit the growth and invasiveness of tumorous cells expressing enzymatically active PSA, in the methods of treatment of the instant invention. Such inhibitors of angiogenesis include, but are not limited to angiostatin and endostatin.

The instant method of treatment may be combined with administration of a compound which inhibits a matrix metalloproteinase in the methods of treatment of the instant invention. Compounds which have inhibitory activity for a matrix metalloproteinase can be readily identified by using assays well-known in the art. For example, see the assays described or cited in PCT Pat. Publ. WO 98/34915 in particular on pp. 24-26.

Prenyl-protein transferase inhibitor compounds that are useful in the methods of the instant invention and are identified by the properties described hereinabove include:

(a) a compound represented by formula (I-a) through (I-c):

wherein with respect to formula (I-a):

5

or a pharmaceutically acceptable salt thereof,

R<sup>1a</sup> and R<sup>1b</sup> are independently selected from:

a) hydrogen,

b) aryl, heterocycle, C3-C10 cycloalkyl, C2-C6 alkenyl, C2-C6 alkynyl,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ , CN,  $NO_2$ ,  $(R^{10})_2N-C(NR^{10})-$ ,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ ,

5

c) C1-C6 alkyl unsubstituted or substituted by aryl, heterocyclyl, C3-C10 cycloalkyl, C2-C6 alkenyl, C2-C6 alkynyl,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ , CN,  $(R^{10})_2N-C(NR^{10})-$ ,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)-NR^{10}-$ ;

10

$R^2$  and  $R^3$  are independently selected from: H; unsubstituted or substituted C1-8 alkyl, unsubstituted or substituted C2-8 alkenyl, unsubstituted or substituted C2-8 alkynyl, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle,

15

wherein the substituted group is substituted with one or more of:

20

1) aryl or heterocycle, unsubstituted or substituted with:

- a) C1-4 alkyl,
- b)  $(CH_2)_pOR^6$ ,
- c)  $(CH_2)_pNR^6R^7$ ,
- d) halogen,

25

- 2) C3-6 cycloalkyl,
- 3)  $OR^6$ ,
- 4)  $SR^6$ ,  $S(O)R^6$ ,  $SO_2R^6$ ,

- 5)  $\text{—NR}^6\text{R}^7$  ,
- 6)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—C—R}^7 \\ || \\ \text{O} \end{array}$  ,
- 7)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—C—NR}^7\text{R}^{7a} \\ || \\ \text{O} \end{array}$  ,
- 8)  $\begin{array}{c} \text{—O—C—NR}^6\text{R}^7 \\ || \\ \text{O} \end{array}$  ,
- 9)  $\begin{array}{c} \text{—O—C—OR}^6 \\ || \\ \text{O} \end{array}$  ,
- 10)  $\begin{array}{c} \text{—C—NR}^6\text{R}^7 \\ || \\ \text{O} \end{array}$  ,
- 11)  $\text{—SO}_2\text{—NR}^6\text{R}^7$  ,
- 12)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—SO}_2\text{—R}^7 \end{array}$  ,
- 13)  $\begin{array}{c} \text{—C—R}^6 \\ || \\ \text{O} \end{array}$  , or
- 14)  $\begin{array}{c} \text{—C—OR}^6 \\ || \\ \text{O} \end{array}$  ; or

5  $\text{R}^2$  and  $\text{R}^3$  are attached to the same C atom and are combined to form  
 10  $\text{—(CH}_2\text{)}_u\text{—}$  wherein one of the carbon atoms is optionally replaced by  
 a moiety selected from: O,  $\text{S(O)}_m$ ,  $\text{—NC(O)—}$ , and  $\text{—N(COR}^{10}\text{)—}$  ;

R<sup>4</sup> and R<sup>5</sup> are independently selected from H and CH<sub>3</sub>; and any two of R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> are optionally attached to the same carbon atom; R<sup>6</sup>, R<sup>7</sup> and R<sup>7a</sup> are independently selected from: H; C<sub>1-4</sub> alkyl, C<sub>3-6</sub> cycloalkyl, heterocycle, aryl, aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted or substituted with:

- a) C<sub>1-4</sub> alkoxy,
- b) aryl or heterocycle,
- c) halogen,
- d) HO,

R<sup>6</sup> and R<sup>7</sup> may be joined in a ring;

R<sup>7</sup> and R<sup>7a</sup> may be joined in a ring;

R<sup>8</sup> is independently selected from:

- a) hydrogen,
- b) aryl, heterocycle, C<sub>3-10</sub> cycloalkyl, C<sub>2-6</sub> alkenyl, C<sub>2-6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, CN, NO<sub>2</sub>, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and
- c) C<sub>1-6</sub> alkyl unsubstituted or substituted by aryl, heterocycle, C<sub>3-10</sub> cycloalkyl, C<sub>2-6</sub> alkenyl, C<sub>2-6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NH-, CN, H<sub>2</sub>N-C(NH)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>10</sup>OC(O)NH-;

R<sup>9</sup> is selected from:

- a) hydrogen,
- b) C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, CN, NO<sub>2</sub>,  
 5 (R<sup>10</sup>)<sub>2</sub>N-C-(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and
- c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, CN, (R<sup>10</sup>)<sub>2</sub>N-C-(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or  
 10 R<sup>11</sup>OC(O)NR<sup>10</sup>-;

R<sup>10</sup> is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, benzyl and aryl;

15 R<sup>11</sup> is independently selected from C<sub>1</sub>-C<sub>6</sub> alkyl and aryl;

A<sup>1</sup> and A<sup>2</sup> are independently selected from: a bond, -CH=CH-, -C≡C-, -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>-, or S(O)<sub>m</sub>;

20

V is selected from:

- a) hydrogen,
- b) heterocycle,
- c) aryl,
- 25 d) C<sub>1</sub>-C<sub>20</sub> alkyl wherein from 0 to 4 carbon atoms are replaced with a heteroatom selected from O, S, and N, and
- e) C<sub>2</sub>-C<sub>20</sub> alkenyl,

provided that V is not hydrogen if A<sup>1</sup> is S(O)<sub>m</sub> and V is not hydrogen if A<sup>1</sup> is a bond, n is 0 and A<sup>2</sup> is S(O)<sub>m</sub>;

30

W is a heterocycle;

X is -CH<sub>2</sub>-, -C(=O)-, or -S(=O)<sub>m</sub>-;

Y is aryl, heterocycle, unsubstituted or substituted with one or more of:

- 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
    - a) C<sub>1-4</sub> alkoxy,
    - b) NR<sup>6</sup>R<sup>7</sup>,
    - 5 c) C<sub>3-6</sub> cycloalkyl,
    - d) aryl or heterocycle,
    - e) HO,
    - f) -S(O)<sub>m</sub>R<sup>6</sup>, or
    - g) -C(O)NR<sup>6</sup>R<sup>7</sup>,
  - 10 2) aryl or heterocycle,
  - 3) halogen,
  - 4) OR<sup>6</sup>,
  - 5) NR<sup>6</sup>R<sup>7</sup>,
  - 6) CN,
  - 15 7) NO<sub>2</sub>,
  - 8) CF<sub>3</sub>;
  - 9) -S(O)<sub>m</sub>R<sup>6</sup>,
  - 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or
  - 11) C<sub>3-C6</sub> cycloalkyl;
- 20
- m is 0, 1 or 2;
- n is 0, 1, 2, 3 or 4;
- p is 0, 1, 2, 3 or 4;
- r is 0 to 5, provided that r is 0 when V is hydrogen;
- 25 s is 0 or 1;
- t is 0 or 1; and
- u is 4 or 5;

with respect to formula (I-b):

or a pharmaceutically acceptable salt thereof,

- 5  $R^{1a}$ ,  $R^{1b}$ ,  $R^{10}$ ,  $R^{11}$ ,  $m$ ,  $R^2$ ,  $R^3$ ,  $R^6$ ,  $R^7$ ,  $p$ ,  $R^{7a}$ ,  $u$ ,  $R^8$ ,  $A^1$ ,  $A^2$ ,  $V$ ,  $W$ ,  $X$ ,  $n$ ,  
 $p$ ,  $r$ ,  $s$ ,  $t$  and  $u$  are as defined above with respect to formula (I-a);

$R^4$  is selected from H and  $CH_3$ ;

- 10 and any two of  $R^2$ ,  $R^3$  and  $R^4$  are optionally attached to the same carbon atom;

$R^9$  is selected from:

- 15 a) hydrogen,  
 b) alkenyl, alkynyl, perfluoroalkyl, F, Cl, Br,  $R^{10}O-$ ,  
 $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ , CN,  $NO_2$ ,  $(R^{10})_2N-C(NR^{10})-$ ,  
 $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ , and  
 c)  $C_1$ - $C_6$  alkyl unsubstituted or substituted by perfluoroalkyl,  
 F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ , CN,  
 20  $(R^{10})_2N-C(NR^{10})-$ ,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  
 $R^{11}OC(O)NR^{10}-$ ;

G is  $H_2$  or O;

- 25 Z is aryl, heteroaryl, arylmethyl, heteroarylmethyl,  
 arylsulfonyl, heteroarylsulfonyl, unsubstituted or  
 substituted with one or more of the following:  
 1)  $C_{1-4}$  alkyl, unsubstituted or substituted with:

- 5
- a) C<sub>1-4</sub> alkoxy,  
 b) NR<sup>6</sup>R<sup>7</sup>,  
 c) C<sub>3-6</sub> cycloalkyl,  
 d) aryl or heterocycle,  
 e) HO,  
 f) -S(O)<sub>m</sub>R<sup>6</sup>, or  
 g) -C(O)NR<sup>6</sup>R<sup>7</sup>,
- 10
- 2) aryl or heterocycle,  
 3) halogen,  
 4) OR<sup>6</sup>,  
 5) NR<sup>6</sup>R<sup>7</sup>,  
 6) CN,  
 7) NO<sub>2</sub>,  
 8) CF<sub>3</sub>;
- 15
- 9) -S(O)<sub>m</sub>R<sup>6</sup>,  
 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or  
 11) C<sub>3-6</sub> cycloalkyl;

with respect to formula (I-c):

or a pharmaceutically acceptable salt thereof,

R<sup>1a</sup>, R<sup>1b</sup>, R<sup>10</sup>, R<sup>11</sup>, m, R<sup>2</sup>, R<sup>3</sup>, R<sup>6</sup>, R<sup>7</sup>, p, u, R<sup>7a</sup>, R<sup>8</sup>, A<sup>1</sup>, A<sup>2</sup>, V, W, X, n,  
 r and t are as defined above with respect to formula (I-a);

R<sup>4</sup> is selected from H and CH<sub>3</sub>; and any two of R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are  
 optionally attached to the same carbon atom;

G is O;

Z is aryl, heteroaryl, arylmethyl, heteroarylmethyl,  
arylsulfonyl, heteroarylsulfonyl, unsubstituted or  
substituted with one or more of the following:

- 5 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
  - a) C<sub>1-4</sub> alkoxy,
  - b) NR<sup>6</sup>R<sup>7</sup>,
  - c) C<sub>3-6</sub> cycloalkyl,
  - 10 d) aryl or heterocycle,
  - e) HO,
  - f) -S(O)<sub>m</sub>R<sup>6</sup>, or
  - g) -C(O)NR<sup>6</sup>R<sup>7</sup>,
- 2) aryl or heterocycle,
- 15 3) halogen,
- 4) OR<sup>6</sup>,
- 5) NR<sup>6</sup>R<sup>7</sup>,
- 6) CN,
- 7) NO<sub>2</sub>,
- 20 8) CF<sub>3</sub>;
- 9) -S(O)<sub>m</sub>R<sup>6</sup>,
- 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or
- 11) C<sub>3-6</sub> cycloalkyl;

25 and

s is 1;

(b) a compound represented by formula (II):

II

wherein:

5 Q is a 4, 5, 6 or 7 membered heterocyclic ring which comprises a nitrogen atom through which Q is attached to Y and 0-2 additional heteroatoms selected from N, S and O, and which also comprises a carbonyl, thiocarbonyl, -C(=NR<sup>13</sup>)- or sulfonyl moiety adjacent to the nitrogen atom attached to Y;

10

Y is a 5, 6 or 7 membered carbocyclic ring wherein from 0 to 3 carbon atoms are replaced by a heteroatom selected from N, S and O, and wherein Y is attached to Q through a carbon atom;

15

R<sup>1</sup> and R<sup>2</sup> are independently selected from:

- a) hydrogen,
- b) aryl, heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, R<sup>11</sup>C(O)O-,  
 20 (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>,  
 -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-,
- c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from  
 25 unsubstituted or substituted aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-,

$R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  
 $R^{10}C(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , and  $R^{11}OC(O)-NR^{10}-$ ;

$R^3$ ,  $R^4$  and  $R^5$  are independently selected from:

- 5      a) hydrogen,
- b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, halogen, C<sub>1</sub>-C<sub>6</sub> perfluoroalkyl,  $R^{12}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{11}C(O)O-$ ,  
 10       $R^{10}_2N-C(NR^{10})-$ , CN,  $NO_2$ ,  $R^{10}C(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ ,
- c) unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl,
- d) substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or  
 15      substituted aryl, unsubstituted or substituted heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl,  $R^{12}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , and  $R^{11}OC(O)-NR^{10}-$ ;

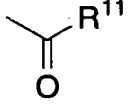

20     $R^{6a}$ ,  $R^{6b}$ ,  $R^{6c}$ ,  $R^{6d}$  and  $R^{6e}$  are independently selected from:

- a) hydrogen,
- b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, halogen, C<sub>1</sub>-C<sub>6</sub> perfluoroalkyl,  $R^{12}O-$ ,  
 25       $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{11}S(O)_2NR^{10}-$ ,  $(R^{10})_2NS(O)_2-$ ,  $R^{11}C(O)O-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $NO_2$ ,  $R^{10}C(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ ,
- c) unsubstituted C<sub>1</sub>-C<sub>6</sub> alkyl,
- d) substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or  
 30      substituted aryl, unsubstituted or substituted heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl,  $R^{12}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{11}S(O)_2NR^{10}-$ ,

$(R^{10})_2NS(O)_2$ -,  $R^{10}_2N-C(NR^{10})$ -, CN,  $R^{10}C(O)$ -,  $N_3$ ,  
 $-N(R^{10})_2$ , and  $R^{11}OC(O)-NR^{10}$ -, or

- 5 any two of  $R^{6a}$ ,  $R^{6b}$ ,  $R^{6c}$ ,  $R^{6d}$  and  $R^{6e}$  on adjacent carbon atoms are  
 combined to form a diradical selected from  $-CH=CH-CH=CH-$ ,  
 $-CH=CH-CH_2-$ ,  $-(CH_2)_4-$  and  $-(CH_2)_3-$ ;

10  $R^7$  is selected from: H;  $C_{1-4}$  alkyl,  $C_{3-6}$  cycloalkyl, heterocycle, aryl,  
 aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted  
 or substituted with:

- a)  $C_{1-4}$  alkoxy,  
 b) aryl or heterocycle,  
 c)   
 d)  $-SO_2R^{11}$ ,  
 e)  $N(R^{10})_2$  or  
 15 f)  $C_{1-4}$  perfluoroalkyl;

$R^8$  is independently selected from:

- a) hydrogen,  
 b) aryl, substituted aryl, heterocycle, substituted heterocycle,  
 20  $C_3-C_{10}$  cycloalkyl,  $C_2-C_6$  alkenyl,  $C_2-C_6$  alkynyl,  
 perfluoroalkyl, F, Cl, Br,  $R^{10}O$ -,  $R^{11}S(O)_m$ -,  $R^{10}C(O)NR^{10}$ -,  
 $(R^{10})_2NC(O)$ -,  $R^{11}S(O)_2NR^{10}$ -,  $(R^{10})_2NS(O)_2$ -,  
 $R^{10}_2N-C(NR^{10})$ -, CN,  $NO_2$ ,  $R^{10}C(O)$ -,  $N_3$ ,  $-N(R^{10})_2$ , or  
 $R^{11}OC(O)NR^{10}$ -, and  
 25 c)  $C_1-C_6$  alkyl unsubstituted or substituted by aryl,  
 cyanophenyl, heterocycle,  $C_3-C_{10}$  cycloalkyl,  $C_2-C_6$  alkenyl,  
 $C_2-C_6$  alkynyl, perfluoroalkyl, F, Cl, Br,  $R^{10}O$ -,  $R^{11}S(O)_m$ -,  
 $R^{10}C(O)NR^{10}$ -,  $(R^{10})_2NC(O)$ -,  $R^{11}S(O)_2NR^{10}$ -,  
 $(R^{10})_2NS(O)_2$ -,  $R^{10}_2N-C(NR^{10})$ -, CN,  $R^{10}C(O)$ -,  $N_3$ ,  
 30  $-N(R^{10})_2$ , or  $R^{10}OC(O)NH$ -;

R<sup>9</sup> is independently selected from:

- a) hydrogen,
- b) alkenyl, alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-,  
R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-,  
5 CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and
- c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by perfluoroalkyl,  
F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-,  
R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or  
R<sup>11</sup>OC(O)NR<sup>10</sup>-;

10

R<sup>10</sup> is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, benzyl, 2,2,2-trifluoroethyl and aryl;

R<sup>11</sup> is independently selected from C<sub>1</sub>-C<sub>6</sub> alkyl and aryl;

15

R<sup>12</sup> is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> aralkyl, C<sub>1</sub>-C<sub>6</sub> substituted aralkyl, C<sub>1</sub>-C<sub>6</sub> heteroaralkyl, C<sub>1</sub>-C<sub>6</sub> substituted heteroaralkyl, aryl, substituted aryl, heteroaryl, substituted heteraryl, C<sub>1</sub>-C<sub>6</sub> perfluoroalkyl, 2-aminoethyl and 2,2,2-trifluoroethyl;

20

R<sup>13</sup> is selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, cyano, C<sub>1</sub>-C<sub>6</sub> alkylsulfonyl and C<sub>1</sub>-C<sub>6</sub> acyl;

25 A<sup>1</sup> and A<sup>2</sup> are independently selected from: a bond, -CH=CH-, -C≡C-, -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>-, or S(O)<sub>m</sub>;

V is selected from:

30

- a) hydrogen,
- b) heterocycle,
- c) aryl,
- d) C<sub>1</sub>-C<sub>20</sub> alkyl wherein from 0 to 4 carbon atoms are replaced with a heteroatom selected from O, S, and N, and

e) C<sub>2</sub>-C<sub>20</sub> alkenyl,  
provided that V is not hydrogen if A<sup>1</sup> is S(O)<sub>m</sub> and V is not hydrogen if  
A<sup>1</sup> is a bond, n is 0 and A<sup>2</sup> is S(O)<sub>m</sub>;

5 W is a heterocycle;

X is a bond, -CH=CH-, O, -C(=O)-, -C(O)NR<sup>7</sup>-, -NR<sup>7</sup>C(O)-, -C(O)O-,  
-OC(O)-, -C(O)NR<sup>7</sup>C(O)-, -NR<sup>7</sup>-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>- or  
-S(=O)<sub>m</sub>-;

10

m is 0, 1 or 2;

n is independently 0, 1, 2, 3 or 4;

p is independently 0, 1, 2, 3 or 4;

q is 0, 1, 2 or 3;

15 r is 0 to 5, provided that r is 0 when V is hydrogen; and

t is 0 or 1;

(c) a compound represented by formula (III):

20 wherein:

R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6a-e</sup>, R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup>, R<sup>10</sup>, R<sup>11</sup>, R<sup>12</sup>, R<sup>13</sup>, A<sup>1</sup>, A<sup>2</sup>, V, W,  
m, n, p, q, r and t are as previously defined with respect to formula  
(II);

Q is a 4, 5, 6 or 7 membered heterocyclic ring which comprises a nitrogen atom through which Q is attached to Y and 0-2 additional heteroatoms selected from N, S and O, and which also comprises a carbonyl, thiocarbonyl,  $-C(=NR^{13})-$  or sulfonyl moiety adjacent to the nitrogen atom attached to Y, provided that Q is not

Y is a 5, 6 or 7 membered carbocyclic ring wherein from 0 to 3 carbon atoms are replaced by a heteroatom selected from N, S and O, and wherein Y is attached to Q through a carbon atom;

(d) a compound represented by formula (IV):

IV

wherein:

**R<sup>1a</sup>, R<sup>1b</sup>, R<sup>1c</sup> and R<sup>1d</sup> are independently selected from:**

- 5 a) hydrogen,  
b) aryl, heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, NO<sub>2</sub>, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-,  
10 c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or substituted aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, and R<sup>11</sup>OC(O)-NR<sup>10</sup>-;  
15

R<sup>2a</sup>, R<sup>2b</sup>, R<sup>3a</sup> and R<sup>3b</sup> are independently selected from: H; unsubstituted or substituted C<sub>1-8</sub> alkyl, unsubstituted or substituted C<sub>2-8</sub> alkenyl, unsubstituted or substituted C<sub>2-8</sub> alkynyl, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle,

wherein the substituted group is substituted with one or more of:

- 5
- 1) aryl or heterocycle, unsubstituted or substituted with:
    - a) C<sub>1-4</sub> alkyl,
    - b) (CH<sub>2</sub>)<sub>p</sub>OR<sup>6</sup>,
    - c) (CH<sub>2</sub>)<sub>p</sub>NR<sup>6</sup>R<sup>7</sup>,
    - d) halogen,
    - e) CN,
  - 2) C<sub>3-6</sub> cycloalkyl,
  - 3) OR<sup>6</sup>,
  - 10 4) SR<sup>4</sup>, S(O)R<sup>4</sup>, SO<sub>2</sub>R<sup>4</sup>,

15) N<sub>3</sub>, or

16) F; or

5 R<sup>2</sup> and R<sup>3</sup> are attached to the same C atom and are combined to form -(CH<sub>2</sub>)<sub>u</sub>- wherein one of the carbon atoms is optionally replaced by a moiety selected from: O, S(O)<sub>m</sub>, -NC(O)-, and -N(COR<sup>10</sup>)-;

and R<sup>2</sup> and R<sup>3</sup> are optionally attached to the same carbon atom;

10 R<sup>4</sup> is selected from: C<sub>1-4</sub> alkyl, C<sub>3-6</sub> cycloalkyl, heterocycle, aryl, unsubstituted or substituted with:

- a) C<sub>1-4</sub> alkoxy,
- b) aryl or heterocycle,
- c) halogen,
- d) HO,

15

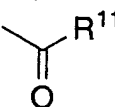

f) -SO<sub>2</sub>R<sup>11</sup>, or

g) N(R<sup>10</sup>)<sub>2</sub>;

20 R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> are independently selected from: H; C<sub>1-4</sub> alkyl, C<sub>3-6</sub> cycloalkyl, heterocycle, aryl, aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted or substituted with:

- a) C<sub>1-4</sub> alkoxy,
- b) aryl or heterocycle,
- c) halogen,

- d) HO,  
 e)   
 f) —SO<sub>2</sub>R<sup>11</sup>, or  
 g) N(R<sup>10</sup>)<sub>2</sub>; or

- 5 R<sup>6</sup> and R<sup>7</sup> may be joined in a ring; and independently, R<sup>5</sup> and R<sup>7</sup> may be joined in a ring;

R<sup>8</sup> is independently selected from:

- 10 a) hydrogen,  
 b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and  
 15 c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NH-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>10</sup>OC(O)NH-;  
 20

R<sup>9</sup> is selected from:

- 25 a) hydrogen,  
 b) C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and  
 30 c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-;

R<sup>10</sup> is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, benzyl, unsubstituted or substituted aryl and unsubstituted or substituted heterocycle;

5

R<sup>11</sup> is independently selected from C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted aryl and unsubstituted or substituted heterocycle;

10

A<sup>1</sup> is selected from: a bond, -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>-, and S(O)<sub>m</sub>;

A<sup>2</sup> is selected from: a bond, -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>-, S(O)<sub>m</sub> and -C(R<sup>1d</sup>)<sub>2</sub>;

15 G<sup>1</sup>, G<sup>2</sup> and G<sup>3</sup> are independently selected from: H<sub>2</sub> and O;

W is heterocycle;

V is selected from:

20

- a) heterocycle, and
- b) aryl;

X and Y are independently selected from: a bond, -C(=O)- or -S(=O)<sub>m</sub>-;

25 Z<sup>1</sup> is selected from: unsubstituted or substituted aryl and unsubstituted or substituted heterocycle, wherein the substituted aryl or substituted heterocycle is substituted with one or more of:

30

1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:

- a) C<sub>1-4</sub> alkoxy,
- b) NR<sup>6</sup>R<sup>7</sup>,
- c) C<sub>3-6</sub> cycloalkyl,
- d) aryl or heterocycle,
- e) HO,
- f) -S(O)<sub>m</sub>R<sup>4</sup>, or
- g) -C(O)NR<sup>6</sup>R<sup>7</sup>,

35

- 2) aryl or heterocycle,  
 3) halogen,  
 4) OR<sup>6</sup>,  
 5) NR<sup>6</sup>R<sup>7</sup>,  
 5 6) CN,  
 7) NO<sub>2</sub>,  
 8) CF<sub>3</sub>,  
 9) -S(O)<sub>m</sub>R<sup>4</sup>,  
 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or  
 10 11) C<sub>3</sub>-C<sub>6</sub> cycloalkyl;

Z<sup>2</sup> is selected from: a bond, unsubstituted or substituted aryl and unsubstituted or substituted heterocycle, wherein the substituted aryl or substituted heterocycle is substituted with one or more of:

- 15 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:  
 a) C<sub>1-4</sub> alkoxy,  
 b) NR<sup>6</sup>R<sup>7</sup>,  
 c) C<sub>3-6</sub> cycloalkyl,  
 d) aryl or heterocycle,  
 20 e) HO,  
 f) -S(O)<sub>m</sub>R<sup>4</sup>, or  
 g) -C(O)NR<sup>6</sup>R<sup>7</sup>,  
 2) aryl or heterocycle,  
 3) halogen,  
 25 4) OR<sup>6</sup>,  
 5) NR<sup>6</sup>R<sup>7</sup>,  
 6) CN,  
 7) NO<sub>2</sub>,  
 8) CF<sub>3</sub>,  
 30 9) -S(O)<sub>m</sub>R<sup>4</sup>,  
 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or  
 11) C<sub>3</sub>-C<sub>6</sub> cycloalkyl;

m is 0, 1 or 2;  
 35 n is 0, 1, 2, 3 or 4;

- p is 0, 1, 2, 3 or 4;  
 q is 1 or 2;  
 r is 0 to 5;  
 s is independently 0, 1, 2 or 3; and  
 5 u is 4 or 5;

(e) a compound represented by formula (V):

wherein:

10

R<sup>1a</sup>, R<sup>1b</sup>, R<sup>1c</sup>, R<sup>1d</sup> and R<sup>1e</sup> are independently selected from:

- a) hydrogen,  
 b) aryl, heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, NO<sub>2</sub>, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-,  
 15 c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or substituted aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, and R<sup>11</sup>OC(O)-NR<sup>10</sup>-;  
 20

25 R<sup>2a</sup>, R<sup>2b</sup>, R<sup>3a</sup> and R<sup>3b</sup> are independently selected from: H; unsubstituted or substituted C<sub>1</sub>-8 alkyl, unsubstituted or substituted C<sub>2</sub>-8 alkenyl,

unsubstituted or substituted C<sub>2-8</sub> alkynyl, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle,

5

wherein the substituted group is substituted with one or more of:

- 1) aryl or heterocycle, unsubstituted or substituted with:
  - a) C<sub>1-4</sub> alkyl,
  - b) (CH<sub>2</sub>)<sub>p</sub>OR<sup>6</sup>,
  - 10 c) (CH<sub>2</sub>)<sub>p</sub>NR<sup>6</sup>R<sup>7</sup>,
  - d) halogen,
  - e) CN,
- 2) C<sub>3-6</sub> cycloalkyl,
- 3) OR<sup>6</sup>,
- 15 4) SR<sup>4</sup>, S(O)R<sup>4</sup>, SO<sub>2</sub>R<sup>4</sup>,

- 5  $\text{R}^2$  and  $\text{R}^3$  are attached to the same C atom and are combined to form  $\text{—(CH}_2\text{)}_u\text{—}$  wherein one of the carbon atoms is optionally replaced by a moiety selected from: O,  $\text{S(O)}_m$ ,  $\text{—NC(O)—}$ , and  $\text{—N(COR}^{10}\text{)—}$ ;

and  $\text{R}^2$  and  $\text{R}^3$  are optionally attached to the same carbon atom;

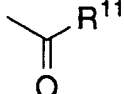

10

$\text{R}^4$  is selected from:  $\text{C}_{1-4}$  alkyl,  $\text{C}_{3-6}$  cycloalkyl, heterocycle, aryl, unsubstituted or substituted with:

- a)  $\text{C}_{1-4}$  alkoxy,
- b) aryl or heterocycle,

c) halogen,

d) HO,

e) 

f)  $-\text{SO}_2\text{R}^{11}$ , or

g)  $\text{N}(\text{R}^{10})_2$ ;

5

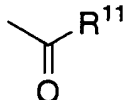

$\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are independently selected from: H; C<sub>1-4</sub> alkyl, C<sub>3-6</sub> cycloalkyl, heterocycle, aryl, aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted or substituted with:

a) C<sub>1-4</sub> alkoxy,

b) aryl or heterocycle,

c) halogen,

d) HO,

e) 

f)  $-\text{SO}_2\text{R}^{11}$ , or

g)  $\text{N}(\text{R}^{10})_2$ ; or

15

$\text{R}^6$  and  $\text{R}^7$  may be joined in a ring; and independently,  $\text{R}^5$  and  $\text{R}^7$  may be joined in a ring;

$\text{R}^8$  is independently selected from:

20

a) hydrogen,

b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3-10</sub> cycloalkyl, C<sub>2-6</sub> alkenyl, C<sub>2-6</sub> alkynyl, perfluoroalkyl, F, Cl, Br,  $\text{R}^{10}\text{O}-$ ,  $\text{R}^{11}\text{S}(\text{O})_m-$ ,  $\text{R}^{10}\text{C}(\text{O})\text{NR}^{10}-$ ,  $(\text{R}^{10})_2\text{NC}(\text{O})-$ ,  $\text{R}^{10}_2\text{N}-\text{C}(\text{NR}^{10})-$ , CN, NO<sub>2</sub>,  $\text{R}^{10}\text{C}(\text{O})-$ ,  $\text{R}^{10}\text{OC}(\text{O})-$ , N<sub>3</sub>,  $-\text{N}(\text{R}^{10})_2$ , or  $\text{R}^{11}\text{OC}(\text{O})\text{NR}^{10}-$ , and

25

c) C<sub>1-6</sub> alkyl unsubstituted or substituted by unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3-10</sub> cycloalkyl, C<sub>2-6</sub> alkenyl, C<sub>2-6</sub> alkynyl,

perfluoroalkyl, F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NH-$ ,  
 $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  
 $N_3$ ,  $-N(R^{10})_2$ , or  $R^{10}OC(O)NH-$ ;

5  $R^9$  is selected from:

- a) hydrogen,
- b) C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br,  
 $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  
 $R^{10}_2N-C(NR^{10})-$ , CN, NO<sub>2</sub>,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  
10  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ , and
- c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by perfluoroalkyl,  
F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  
 $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  
 $R^{11}OC(O)NR^{10}-$ ;

15

$R^{10}$  is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, benzyl,  
unsubstituted or substituted aryl and unsubstituted or  
substituted heterocycle;

20  $R^{11}$  is independently selected from C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or  
substituted aryl and unsubstituted or substituted heterocycle;

$A^1$  is selected from: a bond,  $-C(O)-$ ,  $-C(O)NR^{10}-$ ,  $-NR^{10}C(O)-$ , O,  $-N(R^{10})-$ ,  
 $-S(O)_2N(R^{10})-$ ,  $-N(R^{10})S(O)_2-$ , and  $S(O)_m$ ;

25

$A^2$  is selected from: a bond,  $-C(O)-$ ,  $-C(O)NR^{10}-$ ,  $-NR^{10}C(O)-$ , O,  $-N(R^{10})-$ ,  
 $-S(O)_2N(R^{10})-$ ,  $-N(R^{10})S(O)_2-$ ,  $S(O)_m$  and  $-C(R^{1d})_2-$ ;

W is heteroaryl;

30

V is selected from:

- a) heteroaryl, and
- b) aryl;

X and Y are independently selected from: -C(O)-, -C(O)NR<sup>10</sup>-,  
 -NR<sup>10</sup>C(O)-, -NR<sup>10</sup>C(O)-O-, -O-C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)NR<sup>10</sup>-,  
 -C(O)NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>- and  
 S(O)<sub>m</sub>;

5

Z<sup>1</sup> is selected from: unsubstituted or substituted aryl and unsubstituted  
 or substituted heteroaryl, wherein the substituted aryl or  
 substituted heteroaryl is substituted with one or more of:

- 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
  - 10 a) C<sub>1-4</sub> alkoxy,
  - b) NR<sup>6</sup>R<sup>7</sup>,
  - c) C<sub>3-6</sub> cycloalkyl,
  - d) aryl or heterocycle,
  - e) HO,
  - 15 f) -S(O)<sub>m</sub>R<sup>4</sup>, or
  - g) -C(O)NR<sup>6</sup>R<sup>7</sup>,
- 2) aryl or heterocycle,
- 3) halogen,
- 4) OR<sup>6</sup>,
- 20 5) NR<sup>6</sup>R<sup>7</sup>,
- 6) CN,
- 7) NO<sub>2</sub>,
- 8) CF<sub>3</sub>,
- 9) -S(O)<sub>m</sub>R<sup>4</sup>,
- 25 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or
- 11) C<sub>3-6</sub> cycloalkyl;

Z<sup>2</sup> is selected from: a bond, unsubstituted or substituted aryl and  
 unsubstituted or substituted heteroaryl, wherein the substituted  
 30 aryl or substituted heteroaryl is substituted with one or more of:

- 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
  - a) C<sub>1-4</sub> alkoxy,
  - b) NR<sup>6</sup>R<sup>7</sup>,
  - c) C<sub>3-6</sub> cycloalkyl,

- d) aryl or heterocycle,  
e) HO,  
f)  $-S(O)_mR^4$ , or  
g)  $-C(O)NR^6R^7$ ,
- 5        2) aryl or heterocycle,  
         3) halogen,  
         4)  $OR^6$ ,  
         5)  $NR^6R^7$ ,  
         6) CN,  
10       7)  $NO_2$ ,  
         8)  $CF_3$ ,  
         9)  $-S(O)_mR^4$ ,  
         10)  $-C(O)NR^6R^7$ , or  
         11) C<sub>3</sub>-C<sub>6</sub> cycloalkyl;
- 15
- m is                0, 1 or 2;  
n is                0, 1, 2, 3 or 4;  
p is                0, 1, 2, 3 or 4;  
q is                1 or 2;  
20    r is                0 to 5;  
      s is independently 0, 1, 2 or 3;  
      t is                1, 2, 3 or 4; and  
      u is                4 or 5;

(f) a compound represented by formula (VI):

VI

wherein:

5

R1a, R1b, R1c, R1d and R1e are independently selected from:

- 10 a) hydrogen,  
 b) aryl, heterocycle, C3-C10 cycloalkyl, C2-C6 alkenyl, C2-C6 alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, NO<sub>2</sub>, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-,  
 15 c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or substituted aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>N-C(O)-, CN, (R<sup>10</sup>)<sub>2</sub>N-C(NR<sup>10</sup>)-, R<sup>10</sup>C(O)-, R<sup>10</sup>OC(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, and R<sup>11</sup>OC(O)-NR<sup>10</sup>-;

20 R2a, R2b, R3a and R3b are independently selected from: H; unsubstituted or substituted C<sub>1</sub>-8 alkyl, unsubstituted or substituted C<sub>2</sub>-8 alkenyl, unsubstituted or substituted C<sub>2</sub>-8 alkynyl, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle,

wherein the substituted group is substituted with one or more of:

- 5                    1)    aryl or heterocycle, unsubstituted or substituted with:
- a)    C<sub>1-4</sub> alkyl,
- b)    (CH<sub>2</sub>)<sub>p</sub>OR<sup>6</sup>,
- c)    (CH<sub>2</sub>)<sub>p</sub>NR<sup>6</sup>R<sup>7</sup>,
- d)    halogen,
- e)    CN,
- 10                   2)    C<sub>3-6</sub> cycloalkyl,
- 3)    OR<sup>6</sup>,
- 4)    SR<sup>4</sup>, S(O)R<sup>4</sup>, SO<sub>2</sub>R<sup>4</sup>,

- 5  $\text{R}^2$  and  $\text{R}^3$  are attached to the same C atom and are combined to form  $\text{—(CH}_2\text{)}_n\text{—}$  wherein one of the carbon atoms is optionally replaced by a moiety selected from: O,  $\text{S(O)}_m$ ,  $\text{—NC(O)—}$ , and  $\text{—N(COR}^{10}\text{)—}$ ;

and  $\text{R}^2$  and  $\text{R}^3$  are optionally attached to the same carbon atom;

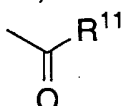

10

$\text{R}^4$  is selected from: C<sub>1-4</sub> alkyl, C<sub>3-6</sub> cycloalkyl, heterocycle, aryl, unsubstituted or substituted with:

- a) C<sub>1-4</sub> alkoxy,
- b) aryl or heterocycle,

c) halogen,

d) HO,

e) 

f)  $-\text{SO}_2\text{R}^{11}$ , or

g)  $\text{N}(\text{R}^{10})_2$ ;

5

$\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are independently selected from: H; C1-4 alkyl, C3-6 cycloalkyl, heterocycle, aryl, aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted or substituted with:

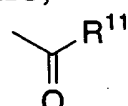

a) C1-4 alkoxy,

10

b) aryl or heterocycle,

c) halogen,

d) HO,

e) 

f)  $-\text{SO}_2\text{R}^{11}$ , or

g)  $\text{N}(\text{R}^{10})_2$ ; or

15

$\text{R}^6$  and  $\text{R}^7$  may be joined in a ring; and independently,  $\text{R}^5$  and  $\text{R}^7$  may be joined in a ring;

$\text{R}^8$  is independently selected from:

20

a) hydrogen,

b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C3-C10 cycloalkyl, C2-C6 alkenyl, C2-C6 alkynyl, perfluoroalkyl, F, Cl, Br,  $\text{R}^{10}\text{O}-$ ,  $\text{R}^{11}\text{S}(\text{O})_m-$ ,  $\text{R}^{10}\text{C}(\text{O})\text{NR}^{10}-$ ,  $(\text{R}^{10})_2\text{NC}(\text{O})-$ ,  $\text{R}^{10}_2\text{N}-\text{C}(\text{NR}^{10})-$ , CN,  $\text{NO}_2$ ,  $\text{R}^{10}\text{C}(\text{O})-$ ,  $\text{R}^{10}\text{OC}(\text{O})-$ ,  $\text{N}_3$ ,  $-\text{N}(\text{R}^{10})_2$ , or  $\text{R}^{11}\text{OC}(\text{O})\text{NR}^{10}-$ , and

25

c) C1-C6 alkyl unsubstituted or substituted by unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C3-C10 cycloalkyl, C2-C6 alkenyl, C2-C6 alkynyl,

perfluoroalkyl, F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NH-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{10}OC(O)NH-$ ;

5  $R^9$  is selected from:

- a) hydrogen,
- b) C2-C6 alkenyl, C2-C6 alkynyl, perfluoroalkyl, F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $NO_2$ ,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ , and
- 10 c) C1-C6 alkyl unsubstituted or substituted by perfluoroalkyl, F, Cl, Br,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $R^{10}OC(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$ , or  $R^{11}OC(O)NR^{10}-$ ;

15

$R^{10}$  is independently selected from hydrogen, C1-C6 alkyl, benzyl, unsubstituted or substituted aryl and unsubstituted or substituted heterocycle;

20  $R^{11}$  is independently selected from C1-C6 alkyl unsubstituted or substituted aryl and unsubstituted or substituted heterocycle;

$A^1$  is selected from: a bond,  $-C(O)-$ ,  $-C(O)NR^{10}-$ ,  $-NR^{10}C(O)-$ , O,  $-N(R^{10})-$ ,  $-S(O)_2N(R^{10})-$ ,  $-N(R^{10})S(O)_2-$ , and  $S(O)_m$ ;

25

$A^2$  is selected from: a bond,  $-C(O)-$ ,  $-C(O)NR^{10}-$ ,  $-NR^{10}C(O)-$ , O,  $-N(R^{10})-$ ,  $-S(O)_2N(R^{10})-$ ,  $-N(R^{10})S(O)_2-$ ,  $S(O)_m$  and  $-C(R^{1d})_2-$ ;

W is heteroaryl;

30

V is selected from:

- a) heteroaryl, and
- b) aryl;

X is selected from: -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, -NR<sup>10</sup>C(O)-O-,  
 -O-C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)NR<sup>10</sup>-, -C(O)NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-,  
 -S(O)<sub>2</sub>N(R<sup>10</sup>)-, -N(R<sup>10</sup>)S(O)<sub>2</sub>- and S(O)<sub>m</sub>;

5 Z<sup>1</sup> is selected from: unsubstituted or substituted aryl and unsubstituted  
 or substituted heteroaryl, wherein the substituted aryl or  
 substituted heteroaryl is substituted with one or more of:

- 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
  - 10 a) C<sub>1-4</sub> alkoxy,
  - b) NR<sup>6</sup>R<sup>7</sup>,
  - c) C<sub>3-6</sub> cycloalkyl,
  - d) aryl or heterocycle,
  - e) HO,
  - f) -S(O)<sub>m</sub>R<sup>4</sup>, or
  - 15 g) -C(O)NR<sup>6</sup>R<sup>7</sup>,
- 2) aryl or heterocycle,
- 3) halogen,
- 4) OR<sup>6</sup>,
- 5) NR<sup>6</sup>R<sup>7</sup>,
- 20 6) CN,
- 7) NO<sub>2</sub>,
- 8) CF<sub>3</sub>,
- 9) -S(O)<sub>m</sub>R<sup>4</sup>,
- 10) -C(O)NR<sup>6</sup>R<sup>7</sup>, or
- 25 11) C<sub>3-6</sub> cycloalkyl;

Z<sup>2</sup> is selected from: a bond, unsubstituted or substituted aryl and  
 unsubstituted or substituted heteroaryl, wherein the substituted  
 aryl or substituted heteroaryl is substituted with one or more of:

- 30 1) C<sub>1-4</sub> alkyl, unsubstituted or substituted with:
  - a) C<sub>1-4</sub> alkoxy,
  - b) NR<sup>6</sup>R<sup>7</sup>,
  - c) C<sub>3-6</sub> cycloalkyl,
  - d) aryl or heterocycle,

- e) HO,  
 f)  $-S(O)_mR^4$ , or  
 g)  $-C(O)NR^6R^7$ ,  
 2) aryl or heterocycle,  
 3) halogen,  
 4)  $OR^6$ ,  
 5)  $NR^6R^7$ ,  
 6) CN,  
 7)  $NO_2$ ,  
 8)  $CF_3$ ,  
 9)  $-S(O)_mR^4$ ,  
 10)  $-C(O)NR^6R^7$ , or  
 11)  $C_3$ - $C_6$  cycloalkyl;  
 15 m is 0, 1 or 2;  
 n is 0, 1, 2, 3 or 4;  
 p is 0, 1, 2, 3 or 4;  
 q is 1 or 2;  
 r is 0 to 5;  
 20 s is independently 0, 1, 2 or 3;  
 t is 1, 2, 3 or 4; and  
 u is 4 or 5;

(g) a compound represented by formula (VII):

wherein:

R<sup>1a</sup>, R<sup>1b</sup> and R<sup>1c</sup> are independently selected from:

- 5       a) hydrogen,
- b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>8</sup>O-, R<sup>9</sup>S(O)<sub>q</sub>-, CN, NO<sub>2</sub>, R<sup>8</sup>C(O)-, R<sup>8</sup>OC(O)-, R<sup>8</sup>(C<sub>1</sub>-C<sub>6</sub> alkyl)O-, N<sub>3</sub>, N(R<sup>8</sup>)<sub>2</sub> or -OC(O)O-heteroaralkyl;
- 10       c) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted by aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>8</sup>O-, R<sup>9</sup>S(O)<sub>q</sub>-, CN, R<sup>8</sup>C(O)-, R<sup>8</sup>OC(O)-, N<sub>3</sub>, or R<sup>8</sup>C(O)O-;

15   R<sup>2</sup> is selected from:

- a) hydrogen,
- b) CN,
- c) NO<sub>2</sub>,
- d) halogen,
- 20       e) aryl, unsubstituted or substituted,
- f) heteroaryl, unsubstituted or substituted,
- g) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted,
- h) N<sub>3</sub>,
- i) R<sup>9</sup>S(O)<sub>q</sub>,
- 25       j) R<sup>8</sup>HC=CH-,
- k) R<sup>8</sup>C≡C-, and
- l) OR<sup>8</sup>;

30   R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> are independently selected from: H, CN, NO<sub>2</sub>, halogen, unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl, N<sub>3</sub>, R<sup>9</sup>S(O)<sub>q</sub>, HC≡C-, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, CF<sub>3</sub>, CF<sub>3</sub>O-, CF<sub>3</sub>CH<sub>2</sub>O-, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, OR<sup>8</sup>, N(R<sup>8</sup>)<sub>2</sub>, -C(O)R<sup>8</sup>, -O(C<sub>1</sub>-C<sub>6</sub> alkyl)OR<sup>8</sup>, -NHC(O)R<sup>8</sup>,

aralkyl, heteroaralkyl,  $-(C_1-C_6 \text{ alkyl})OR^8$ ,  $-(C_1-C_6 \text{ alkyl})C(O)R^8$ , -

$R^6$  is independently selected from:

- 5      a) hydrogen,
- b) CN,
- c)  $NO_2$ ,
- d) halogen,
- e) aryl, unsubstituted or substituted,
- 10     f) heteroaryl, unsubstituted or substituted,
- g)  $C_1-C_6$  alkyl, unsubstituted or substituted,
- h)  $R^8O-$ ,
- i)  $N_3$ ,
- j)  $R^9S(O)_q-$ ,
- 15     k)  $-HC=CH_2$ ,
- l)  $-C\equiv CH$ ,
- m)  $CF_3$ ,
- n)  $R^8O(C=O)-$ , and
- o)  $R^8(O=C)O-$ ;

20

$R^8$  is independently selected from hydrogen, unsubstituted or substituted  $C_1-C_6$  alkyl, cycloalkyl, benzyl and unsubstituted or substituted aryl;

- 25      $R^9$  is independently selected from H, unsubstituted or substituted  $C_1-C_6$  alkyl, benzyl and unsubstituted or substituted aryl;

- 30      $R^{13}$  is independently selected from H, unsubstituted or substituted  $C_1-C_6$  alkyl, unsubstituted or substituted aryl, unsubstituted or substituted heterocycle,  $-(C_1-C_6 \text{ alkyl})OR^8$ ,  $-(C_1-C_6 \text{ alkyl})OC(O)(C_1-C_6 \text{ alkyl})$ ,  $-(C_1-C_6 \text{ alkyl})N(R^8)_2$ , and  $-(C_1-C_6 \text{ alkyl})NHC(O)(C_1-C_6 \text{ alkyl})R^8$ ;

A<sup>1</sup>, A<sup>2</sup> and A<sup>3</sup> are independently selected from:

- a) a bond,
- b) -HC=CH-,
- c) -C≡C-,
- 5 d) -O-,
- e) -(C=O)-,
- f) -O(C=O)-,
- g) -(C=O)O-,
- h) -NR<sup>8</sup>-,
- 10 i) -C(O)N(R<sup>8</sup>)-,
- j) -N(R<sup>8</sup>)C(O)-,
- k) -NHC(O)NH-,
- l) -S(O)<sub>q</sub>-,
- m) -S(O)<sub>q</sub>NH-, and
- 15 n) -NHS(O)<sub>q</sub>-;

A<sup>4</sup> is selected from a bond, C(O), C=CH<sub>2</sub>, or spiro C<sub>3</sub>-C<sub>6</sub> cycloalkyl;

W is selected from:

- 20 a) hydrogen,
- b) heterocycle, and
- c) aryl;

X is selected from:

- 25 a) aryl,
- b) cycloalkyl,
- c) heterocycle, and
- d) a bond;

30 Y is selected from:

- a) aryl, unsubstituted or substituted,
- b) heterocycle, unsubstituted or substituted, and
- c) cycloalkyl;

- m is 0, 1, 2, 3 or 4;  
 n is 0, 1, 2, 3 or 4;  
 p is 0, 1, 2, 3 or 4;  
 q is 0, 1 or 2;  
 5 r is 0, 1, 2 or 3;  
 s is 0, 1, 2, 3 or 4; and;  
 t is 0, 1, 2 or 3;

provided that

is not a bond;

(h) a compound represented by formula (VIII):

15

wherein:

R1a, R1b and R1c are independently selected from:

- a) hydrogen,

- b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>8</sup>O-, R<sup>9</sup>S(O)<sub>q</sub>-, CN, NO<sub>2</sub>, R<sup>8</sup>C(O)-, R<sup>8</sup>OC(O)-, N(R<sup>8</sup>)<sub>2</sub>, (R<sup>8</sup>)<sub>2</sub>NC(O)-, C(O)N(R<sup>8</sup>)<sub>2</sub>-, or N<sub>3</sub>;
- 5 c) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted by unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>8</sup>O-, R<sup>9</sup>S(O)<sub>q</sub>-, CN, R<sup>8</sup>C(O)-, R<sup>8</sup>OC(O)-, N(R<sup>8</sup>)<sub>2</sub>, N<sub>3</sub>, or R<sup>8</sup>C(O)O-;

10 R<sup>1</sup> is selected from:

- a) H,
- b) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl,
- c) unsubstituted or substituted aryl,
- d) unsubstituted or substituted heterocycle,
- 15 e) -(C<sub>1</sub>-C<sub>6</sub> alkyl)N(R<sup>8</sup>)<sub>2</sub>,
- f) -R<sup>8</sup>C(O)R<sup>8</sup>,
- g) -(C<sub>1</sub>-C<sub>6</sub> alkyl)OR<sup>8</sup>,
- h) -N(R<sup>8</sup>)<sub>2</sub>,
- i) -OR<sup>8</sup>,
- 20 j) -R<sup>8</sup>NHC(O)R<sup>8</sup>,
- k) -R<sup>8</sup>C(O)N(R<sup>8</sup>)<sub>2</sub>,
- l) CF<sub>3</sub>,
- m) halo,
- n) -C(O)OR<sup>8</sup>,
- 25 o) C<sub>2</sub>-C<sub>6</sub> alkynyl,
- p) C<sub>2</sub>-C<sub>6</sub> alkenyl,
- q) perfluoroalkyl,
- r) N<sub>3</sub>,
- s) NO<sub>2</sub>,
- 30 t) CN,
- u) R<sup>9</sup>S(O)<sub>q</sub>-;

R<sup>2</sup> is selected from:

- a) hydrogen,
- 35 b) CN,

- 5
- c) NO<sub>2</sub>,
  - d) halogen,
  - e) aryl, unsubstituted or substituted,
  - f) heteroaryl, unsubstituted or substituted,
  - g) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted,
  - h) OR<sup>8</sup>,
  - i) N<sub>3</sub>,
  - j) R<sup>9</sup>S(O)<sub>q</sub>,
  - k) R<sup>8</sup>HC=CH-, and
  - 10 l) R<sup>8</sup>C≡C-;

R<sup>3</sup> is selected from:

- 15
- a) H,
  - b) CN,
  - c) NO<sub>2</sub>,
  - d) halogen,
  - e) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted,
  - f) OR<sup>8</sup>,
  - g) aryl, unsubstituted or substituted,
  - 20 h) heteroaryl, unsubstituted or substituted, and
  - i) CF<sub>3</sub>;

R<sup>4</sup> is selected from:

- 25
- a) H,
  - b) =O, or
  - c) =S;

R<sup>5</sup> is selected from:

- 30
- a) H,
  - b) CN,
  - c) NO<sub>2</sub>,
  - d) halogen,
  - e) C<sub>1</sub>-C<sub>6</sub> alkyl, unsubstituted or substituted,
  - f) N<sub>3</sub>,

- g)  $R^9S(O)_q$ ,
- h)  $-HC=CH_2$ ,
- i)  $HC\equiv C-$ ,
- j) aryl, unsubstituted or substituted,
- 5 k) heterocycle, unsubstituted or substituted,
- l)  $CF_3O-$ ,
- m)  $CF_3CH_2O-$ ,
- n)  $C_3-C_{10}$  cycloalkyl,
- o)  $CF_3$ ,
- 10 p)  $-(C_1-C_6 \text{ alkyl})N(R^8)_2$ ,
- q)  $-(C_1-C_6 \text{ alkyl})OR^8$ ,
- r)  $OR^8$ ,
- s)  $N(R^8)_2$ ,
- t)  $-C(O)(C_1-C_6 \text{ alkyl})$ , and
- 15 u)  $-(C_1-C_6 \text{ alkyl})C(O)R^8$ ;

$R^6$  is selected from:

- a) H,
- b)  $C_1-C_6$  alkyl, unsubstituted or substituted,
- 20 c)  $OR^8$ , and
- d)  $-C(O)(C_1-C_6 \text{ alkyl})$ ;

$R^8$  is independently selected from hydrogen, unsubstituted or substituted  $C_1-C_6$  alkyl, unsubstituted or substituted benzyl, unsubstituted or substituted heterocycle and unsubstituted or substituted aryl;

25

$R^9$  is independently selected from unsubstituted or substituted  $C_1-C_6$  alkyl, unsubstituted or substituted benzyl and unsubstituted or substituted aryl;

30

$A^1$  and  $A^2$  are independently selected from:

- a) a bond,
- b)  $-HC=CH-$ ,
- c)  $-C\equiv C-$ ,

- 5
- d) O,
  - e) S(O)<sub>q</sub>,
  - f) OC(O),
  - g) C(O),
  - h) C(O)O, and
  - i) NR<sub>8</sub>;

A<sup>3</sup> is selected from a bond, -C(=O),  and C<sub>3</sub>-C<sub>6</sub> cycloalkyl;

10 M is selected from CH<sub>2</sub>, NH, O or S;

W is selected from:

- 15
- a) hydrogen,
  - b) heterocycle, and
  - c) aryl;

Y is selected from:

- 20
- a) aryl, and
  - b) heterocycle;

Z is selected from:

- 25
- a) aryl,
  - b) heterocycle,
  - c) C<sub>3</sub>-C<sub>6</sub> cycloalkyl, and
  - d) a bond;

- 30
- m is 0, 1, 2, 3 or 4;
  - n is 0, 1, 2, 3 or 4;
  - p is 0, 1, 2, 3 or 4;
  - q is 0, 1 or 2;
  - r is 0, 1, 2, 3, or 4;
  - s is 0, 1, 2, 3 or 4;
  - t is 0, 1, 2 or 3;

(I) a compound represented by formula (VIII A):

wherein:

5 R<sup>1a</sup> and R<sup>1b</sup> are independently selected from:

- a) hydrogen,
- b) aryl, heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, R<sup>10</sup>NC(O)-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-,
- 10 c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or substituted aryl, heterocyclic, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN,
- 15 R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, and R<sup>11</sup>OC(O)-NR<sup>10</sup>-;

R<sup>1c</sup> is independently selected from:

- a) hydrogen,
- 20 b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub> or R<sup>11</sup>OC(O)NR<sup>10</sup>-,
- 25 c) unsubstituted or substituted C<sub>1</sub>-C<sub>6</sub> alkyl wherein the substituent on the substituted C<sub>1</sub>-C<sub>6</sub> alkyl is selected from unsubstituted or substituted aryl, unsubstituted or

substituted heterocycle, C3-C10 cycloalkyl, C2-C6 alkenyl,  
 C2-C6 alkynyl,  $R^{10}O-$ ,  $R^{11}S(O)_m-$ ,  $R^{10}C(O)NR^{10}-$ ,  
 $(R^{10})_2NC(O)-$ ,  $R^{10}_2N-C(NR^{10})-$ , CN,  $R^{10}C(O)-$ ,  $N_3$ ,  $-N(R^{10})_2$   
 and  $R^{11}OC(O)-NR^{10}-$ ;

- 5 or two  $R^{1c}$ s on the same carbon are combined with that carbon to  
 form a C4-C6 cycloalkyl or C6-C10 multicyclic alkyl ring;

10  $R^2$  and  $R^3$  are independently selected from: H; unsubstituted or substituted  
 C1-8 alkyl, unsubstituted or substituted C2-8 alkenyl, unsubstituted or  
 substituted C2-8 alkynyl, unsubstituted or substituted aryl,

unsubstituted or substituted heterocycle,

wherein the substituted group is substituted with one or more of:

- 1) aryl or heterocycle, unsubstituted or substituted with:
  - 15 a) C1-4 alkyl,
  - b)  $(CH_2)_pOR^6$ ,
  - c)  $(CH_2)_pNR^6R^7$ ,
  - d) halogen,
  - e) CN,
  - f) aryl or heteroaryl,
  - 20 g) perfluoro-C1-4 alkyl,
  - h)  $SR^{6a}$ ,  $S(O)R^{6a}$ ,  $SO_2R^{6a}$ ,
- 2) C3-6 cycloalkyl,
- 3)  $OR^6$ ,
- 4)  $SR^{6a}$ ,  $S(O)R^{6a}$ , or  $SO_2R^{6a}$ ,

25

- 5)  $\text{—NR}^6\text{R}^7$  ,
- 6)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—C—R}^7 \\ || \\ \text{O} \end{array}$  ,
- 7)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—C—NR}^7\text{R}^{7a} \\ || \\ \text{O} \end{array}$  ,
- 8)  $\begin{array}{c} \text{—O—C—NR}^6\text{R}^7 \\ || \\ \text{O} \end{array}$  ,
- 9)  $\begin{array}{c} \text{—O—C—OR}^6 \\ || \\ \text{O} \end{array}$  ,
- 10)  $\begin{array}{c} \text{C—C—NR}^6\text{R}^7 \\ || \\ \text{O} \end{array}$  ,
- 11)  $\text{—SO}_2\text{—NR}^6\text{R}^7$  ,
- 12)  $\begin{array}{c} \text{R}^6 \\ | \\ \text{—N—SO}_2\text{—R}^{6a} \end{array}$  ,
- 13)  $\begin{array}{c} \text{C—C—R}^6 \\ || \\ \text{O} \end{array}$  ,
- 14)  $\begin{array}{c} \text{C—C—OR}^6 \\ || \\ \text{O} \end{array}$  ,
- 15)  $\text{N}_3$ ,
- 16)  $\text{F}$ , or
- 17) perfluoro- $\text{C}_{1-4}$ -alkyl; or

$R^2$  and  $R^3$  are attached to the same C atom and are combined to form  $-(CH_2)_u-$  wherein one of the carbon atoms is optionally replaced by a moiety selected from: O,  $S(O)_m$ ,  $-NC(O)-$ , and  $-N(COR^{10})-$ ;

5

$R^4$  is selected from H and  $CH_3$ ;

and any two of  $R^2$ ,  $R^3$  and  $R^4$  are optionally attached to the same carbon atom;

10

$R^6$ ,  $R^7$  and  $R^{7a}$  are independently selected from: H;  $C_{1-4}$  alkyl,  $C_{3-6}$  cycloalkyl, heterocycle, aryl, aroyl, heteroaroyl, arylsulfonyl, heteroarylsulfonyl, unsubstituted or substituted with:

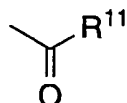

15

a)  $C_{1-4}$  alkoxy,

b) aryl or heterocycle,

c) halogen,

d) HO,

e) 

f)  $-SO_2R^{11}$  , or

g)  $N(R^{10})_2$ ; or

20

$R^6$  and  $R^7$  may be joined in a ring;

$R^7$  and  $R^{7a}$  may be joined in a ring;

25  $R^{6a}$  is selected from:  $C_{1-4}$  alkyl,  $C_{3-6}$  cycloalkyl, heterocycle, aryl, unsubstituted or substituted with:

a)  $C_{1-4}$  alkoxy,

b) aryl or heterocycle,

c) halogen,

30

d) HO,

R<sup>8</sup> is independently selected from:

- 5        a) hydrogen,  
          b) unsubstituted or substituted aryl, unsubstituted or substituted heterocycle, unsubstituted or substituted C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and  
 10        c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by aryl, cyanophenyl, heterocycle, C<sub>3</sub>-C<sub>10</sub> cycloalkyl, C<sub>2</sub>-C<sub>6</sub> alkenyl, C<sub>2</sub>-C<sub>6</sub> alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NH-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>10</sup>OC(O)NH-;  
 15

R<sup>9</sup> is selected from:

- 20        a) hydrogen,  
          b) alkenyl, alkynyl, perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, NO<sub>2</sub>, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-, and  
          c) C<sub>1</sub>-C<sub>6</sub> alkyl unsubstituted or substituted by perfluoroalkyl, F, Cl, Br, R<sup>10</sup>O-, R<sup>11</sup>S(O)<sub>m</sub>-, R<sup>10</sup>C(O)NR<sup>10</sup>-, (R<sup>10</sup>)<sub>2</sub>NC(O)-, R<sup>10</sup><sub>2</sub>N-C(NR<sup>10</sup>)-, CN, R<sup>10</sup>C(O)-, N<sub>3</sub>, -N(R<sup>10</sup>)<sub>2</sub>, or R<sup>11</sup>OC(O)NR<sup>10</sup>-;  
 25

R<sup>10</sup> is independently selected from hydrogen, C<sub>1</sub>-C<sub>6</sub> alkyl, benzyl and aryl;

30

R<sup>11</sup> is independently selected from C<sub>1</sub>-C<sub>6</sub> alkyl and aryl;

A<sup>1</sup> and A<sup>2</sup> are independently selected from: a bond, -CH=CH-, -C≡C-,  
 -C(O)-, -C(O)NR<sup>10</sup>-, -NR<sup>10</sup>C(O)-, O, -N(R<sup>10</sup>)-, -S(O)<sub>2</sub>N(R<sup>10</sup>)-,  
 -N(R<sup>10</sup>)S(O)<sub>2</sub>-, or S(O)<sub>m</sub>;

5

A<sup>3</sup> is selected from: -C(O)-, -C(O)NR<sup>10</sup>-, -C(O)O-, and S(O)<sub>m</sub>;

A<sup>4</sup> is selected from: a bond, O, and NR<sup>10</sup>;

10 V is selected from:

- a) hydrogen,
- b) heterocycle,
- c) aryl,
- d) C<sub>1</sub>-C<sub>20</sub> alkyl wherein from 0 to 4 carbon atoms are replaced
- 15 with a heteroatom selected from O, S, and N, and
- e) C<sub>2</sub>-C<sub>20</sub> alkenyl,

provided that V is not hydrogen if A<sup>1</sup> is S(O)<sub>m</sub> and V is not hydrogen if  
 A<sup>1</sup> is a bond, n is 0 and A<sup>2</sup> is S(O)<sub>m</sub>;

20 W is a heterocycle;

Z is unsubstituted or substituted aryl or unsubstituted or  
 substituted heteroaryl;

25 m is 0, 1 or 2;

n is 0, 1, 2, 3 or 4;

p is 0, 1, 2, 3 or 4;

q is 1 or 2;

r is 0 to 5, provided that r is 0 when V is hydrogen;

30 s is 0 or 1;

t is 0 or 1;

u is 4 or 5; and

v is 0, 1, 2 or 3; provided that v is not 0 if A<sup>3</sup> is -C(O)- or S(O)<sub>m</sub>;

35 or a pharmaceutically acceptable salt or optical isomer thereof.

Examples of compounds which inhibit prenyl protein transferase include the following:

- 2(S)-Butyl-1-(2,3-diaminoprop-1-yl)-1-(1-naphthoyl)piperazine;
- 5 1-(3-Amino-2-(2-naphthylmethylamino)prop-1-yl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 10 2(S)-Butyl-1-{5-[1-(2-naphthylmethyl)]-4,5-dihydroimidazol}methyl-4-(1-naphthoyl)piperazine;
- 1-[5-(1-Benzylimidazol)methyl]-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 15 1-{5-[1-(4-nitrobenzyl)]imidazolylmethyl}-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 1-(3-Acetamidomethylthio-2(R)-aminoprop-1-yl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 20 2(S)-Butyl-1-[2-(1-imidazolyl)ethyl]sulfonyl-4-(1-naphthoyl)piperazine;
- 2(R)-Butyl-1-imidazolyl-4-methyl-4-(1-naphthoyl)piperazine;
- 2(S)-Butyl-4-(1-naphthoyl)-1-(3-pyridylmethyl)piperazine;
- 25 1-2(S)-butyl-(2(R)-(4-nitrobenzyl)amino-3-hydroxypropyl)-4-(1-naphthoyl)piperazine;
- 1-(2(R)-Amino-3-hydroxyheptadecyl)-2(S)-butyl-4-(1-naphthoyl)-
- 30 piperazine;
- 2(S)-Benzyl-1-imidazolyl-4-methyl-4-(1-naphthoyl)piperazine;
- 1-(2(R)-Amino-3-(3-benzylthio)propyl)-2(S)-butyl-4-(1-
- 35 naphthoyl)piperazine;

- 1-(2(R)-Amino-3-[3-(4-nitrobenzylthio)propyl])-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 5 2(S)-Butyl-1-[(4-imidazolyl)ethyl]-4-(1-naphthoyl)piperazine;
- 2(S)-Butyl-1-[(4-imidazolyl)methyl]-4-(1-naphthoyl)piperazine;
- 10 2(S)-Butyl-1-[(1-naphth-2-ylmethyl)-1H-imidazol-5-yl]acetyl]-4-(1-naphthoyl)piperazine;
- 2(S)-Butyl-1-[(1-naphth-2-ylmethyl)-1H-imidazol-5-yl]ethyl]-4-(1-naphthoyl)piperazine;
- 15 1-(2(R)-Amino-3-hydroxypropyl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 1-(2(R)-Amino-4-hydroxybutyl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 1-(2-Amino-3-(2-benzyloxyphenyl)propyl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 20 1-(2-Amino-3-(2-hydroxyphenyl)propyl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 25 1-[3-(4-imidazolyl)propyl]-2(S)-butyl-4-(1-naphthoyl)-piperazine;
- 2(S)-*n*-Butyl-4-(2,3-dimethylphenyl)-1-(4-imidazolylmethyl)-piperazin-5-one;
- 30 2(S)-*n*-Butyl-1-[1-(4-cyanobenzyl)imidazol-5-ylmethyl]-4-(2,3-dimethylphenyl)piperazin-5-one;
- 1-[1-(4-Cyanobenzyl)imidazol-5-ylmethyl]-4-(2,3-dimethylphenyl)-2(S)-(2-methoxyethyl)piperazin-5-one;
- 35

- 2(S)-*n*-Butyl-4-(1-naphthoyl)-1-[1-(1-naphthylmethyl)imidazol-5-ylmethyl]-piperazine;
- 5 2(S)-*n*-Butyl-4-(1-naphthoyl)-1-[1-(2-naphthylmethyl)imidazol-5-ylmethyl]-piperazine;
- 2(S)-*n*-Butyl-1-[1-(4-cyanobenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)piperazine;
- 10 2(S)-*n*-Butyl-1-[1-(4-methoxybenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)piperazine;
- 2(S)-*n*-Butyl-1-[1-(3-methyl-2-butenyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)piperazine;
- 15 2(S)-*n*-Butyl-1-[1-(4-fluorobenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)piperazine;
- 2(S)-*n*-Butyl-1-[1-(4-chlorobenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)piperazine;
- 20 1-[1-(4-Bromobenzyl)imidazol-5-ylmethyl]-2(S)-*n*-butyl-4-(1-naphthoyl)piperazine;
- 25 2(S)-*n*-Butyl-4-(1-naphthoyl)-1-[1-(4-trifluoromethylbenzyl)imidazol-5-ylmethyl]-piperazine;
- 2(S)-*n*-Butyl-1-[1-(4-methylbenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)-piperazine;
- 30 2(S)-*n*-Butyl-1-[1-(3-methylbenzyl)imidazol-5-ylmethyl]-4-(1-naphthoyl)-piperazine;
- 1-[1-(4-Phenylbenzyl)imidazol-5-ylmethyl]-2(S)-*n*-butyl-4-(1-naphthoyl)-piperazine;
- 35

- 2(S)-*n*-Butyl-4-(1-naphthoyl)-1-[1-(2-phenylethyl)imidazol-5-ylmethyl]-piperazine;
- 5 2(S)-*n*-Butyl-4-(1-naphthoyl)-1-[1-(4-trifluoromethoxy)imidazol-5-ylmethyl]piperazine;
- 10 1-[[1-(4-cyanobenzyl)-1H-imidazol-5-yl]acetyl]-2(S)-*n*-butyl-4-(1-naphthoyl)piperazine;
- (S)-1-(3-Chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[2-(methanesulfonyl)ethyl]-2-piperazinone;
- 15 (S)-1-(3-Chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[2-(ethanesulfonyl)ethyl]-2-piperazinone;
- (R)-1-(3-Chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[2-(ethanesulfonyl)methyl]-2-piperazinone;
- 20 (S)-1-(3-Chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[N-ethyl-2-acetamido]-2-piperazinone;
- (±)-5-(2-Butynyl)-1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-2-piperazinone;
- 25 1-(3-Chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-2-piperazinone;
- 5(S)-Butyl-4-[1-(4-cyanobenzyl)-2-methyl]-5-imidazolylmethyl]-1-(2,3-dimethylphenyl)-piperazin-2-one;
- 30 4-[1-(2-(4-Cyanophenyl)-2-propyl)-5-imidazolylmethyl]-1-(3-chlorophenyl)-5(S)-(2-methylsulfonyl)ethyl)piperazin-2-one;
- 35 5(S)-*n*-Butyl-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-1-(2-methylphenyl)piperazin-2-one;

30

The following compounds which are inhibitors of farnesyl-protein transferase are particularly useful in the methods of treatment described herein:

(+)-6-[amino(4-chlorophenyl)(1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-methyl-2(1H)-quinolinone (Compound J)

35

J

5 (-)-6-[amino(4-chlorophenyl)(1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-methyl-2(1H)-quinolinone (Compound J-A; designated "comp. 74" in WO 97/21701)

10 (+)-6-[amino(4-chlorophenyl)(1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-methyl-2(1H)-quinolinone (Compound J-B; designated "comp. 75" in WO 97/21701)

or a pharmaceutically acceptable salt thereof. The syntheses of these compounds are specifically described in PCT Publication WO 97/21701, in particular on pages 19-28. The preferred compound among these compounds to use in combination with a PSA conjugate is Compound J-B.

The following compound which is an inhibitor of farnesyl-protein transferase is particularly useful in the methods of treatment described herein:

or a pharmaceutically acceptable salt thereof. The synthesis of this compound is specifically described in PCT Publication WO 97/23478, in particular on pages 18-56. In WO 97/23478, the above compound is  
5 designated compound "39.0" and is specifically described in Example 10.

Compounds which are inhibitors of farnesyl-protein transferase and are therefore useful in the present invention, and methods of synthesis thereof, can be found in the following patents, pending applications and publications, which are herein incorporated by

PSA conjugates that are useful in the methods of the instant invention and are identified by the properties described hereinabove include:

15

a) a compound represented by the formula IX:

20 wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being

proteolytically cleaved by the enzymatic activity of the free prostate specific antigen;

X<sub>L</sub> is absent or is an amino acid selected from:

- 5           a)    phenylalanine,
- b)    leucine,
- c)    valine,
- d)    isoleucine,
- e)    (2-naphthyl)alanine,
- 10          f)    cyclohexylalanine,
- g)    diphenylalanine,
- h)    norvaline, and
- j)    norleucine;

15   R is hydrogen or  $-(C=O)R^1$ ; and

      R<sup>1</sup> is C<sub>1</sub>-C<sub>6</sub>-alkyl or aryl,

      or the pharmaceutically acceptable salt thereof;

20

      b)    a compound represented by the formula X:

X

wherein:

- 5 oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen;
- 10 X<sub>L</sub> is absent or is an amino acid selected from:
- a) phenylalanine,
  - b) leucine,
  - c) valine,
  - d) isoleucine,
  - 15 e) (2-naphthyl)alanine,
  - f) cyclohexylalanine,
  - g) diphenylalanine,
  - h) norvaline, and
  - j) norleucine; or

20

X<sub>L</sub> is -NH-(CH<sub>2</sub>)<sub>n</sub>-NH-

R is hydrogen or  $-(C=O)R^1$ ;

$R^1$  is  $C_1$ - $C_6$ -alkyl or aryl;

5

$R^{19}$  is hydrogen or acetyl; and

n is 1, 2, 3, 4 or 5,

10 or the pharmaceutically acceptable salt thereof;

c) a compound represented by the formula XI:

15

wherein:

oligopeptide is an oligopeptide which is selectively recognized by the free prostate specific antigen (PSA) and is capable of being  
 20 proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, wherein the oligopeptide comprises a cyclic amino acid of the formula:

and wherein

the C-terminus carbonyl is covalently bound to the amine of doxorubicin;

5

R is selected from

- a) hydrogen,
- b)  $-(C=O)R^{1a}$ ,
- c)

10

d)

15

e)

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

20

$R^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

$R^5$  is selected from HO- and C<sub>1</sub>-C<sub>6</sub> alkoxy;

$R^6$  is selected from hydrogen, halogen, C<sub>1</sub>-C<sub>6</sub> alkyl, HO- and C<sub>1</sub>-C<sub>6</sub>  
 5 alkoxy; and

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

10 r is an integer between 1 and 10; and

t is 3 or 4;

or a pharmaceutically acceptable salt thereof;

15 d) a compound represented by the formula X:

wherein:

20

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, and the oligopeptide comprises a cyclic amino acid of the formula:

5

XL is -NH-(CH<sub>2</sub>)<sub>u</sub>-NH-

R is selected from

10

- a) hydrogen,
- b) -(C=O)R<sup>1a</sup>,
- c)

15

d)

e)

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

$R^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated aryl, polyhydroxylated aryl or aryl,

5

$R^{19}$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

$n$  is 1, 2, 3 or 4;

10  $p$  is zero or an integer between 1 and 100;

$q$  is 0 or 1, provided that if  $p$  is zero,  $q$  is 1;

$r$  is 1, 2 or 3;

$t$  is 3 or 4;

$u$  is 1, 2, 3, 4 or 5,

15

or the pharmaceutically acceptable salt thereof;

e) a compound represented by the formula XI:

20

wherein:

oligopeptide is an oligopeptide which is selectively recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, and wherein the C-terminus carbonyl is covalently bound to the amine of doxorubicin and the N-terminus amine is covalently bound to the carbonyl of the blocking group;

R is selected from

10 a)

b)

15

R<sup>1</sup> and R<sup>2</sup> are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

20 q is 0 or 1, provided that if p is zero, q is 1;

or the pharmaceutically acceptable salt thereof;

f) a compound represented by the formula XIV:

25

wherein:

- 5 oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen;

- 10 X<sub>L</sub> is -NH-(CH<sub>2</sub>)<sub>r</sub>-NH-

R is selected from

a)

15

b)

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

$R^{19}$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

n is 1, 2, 3 or 4;  
 p is zero or an integer between 1 and 100;  
 q is 0 or 1, provided that if p is zero, q is 1;  
 10 r is 1, 2, 3, 4 or 5,

or the pharmaceutically acceptable salt thereof;

g) a compound represented by the formula XV:

wherein:

20 oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being

proteolytically cleaved by the enzymatic activity of the free prostate specific antigen,

$X_L$  is  $-NH-(CH_2)_u-W-(CH_2)_u-NH-$

5

R is selected from

- a) hydrogen,
- b)  $-(C=O)R^{1a}$ ,
- c)

10

d)

15

e)

- f) ethoxysquarate, and
- g) cotininylnyl;

20  $R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 aralkyl and aryl;

$R^{1a}$  is C1-C6-alkyl, hydroxylated C3-C8-cycloalkyl, polyhydroxylated C3-C8-cycloalkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

25

$R^9$  is hydrogen, (C1-C3 alkyl)-CO, or chlorosubstituted (C1-C3 alkyl)-CO;

W is selected from cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.2]octanyl;

n is 1, 2, 3 or 4;

5 p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

r is 1, 2 or 3;

t is 3 or 4;

u is 0, 1, 2 or 3,

10

or the pharmaceutically acceptable salt thereof; and

h) a compound represented by the formula XVI:

15

wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen,

20

$X_L$  is selected from: a bond,  $-C(O)-(CH_2)_u-W-(CH_2)_u-O-$  and  $-C(O)-(CH_2)_u-W-(CH_2)_u-NH-$ ;

R is selected from

- 5      a) hydrogen,  
       b)  $-(C=O)R^{1a}$ ,  
       c)

- 10      d)

- e)

- 15      f) ethoxysquarate, and  
       g) cotininyll;

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH,  $C_1$ - $C_6$  alkyl,  $C_1$ - $C_6$  alkoxy,  $C_1$ - $C_6$  aralkyl and aryl;

20

$R^{1a}$  is  $C_1$ - $C_6$ -alkyl, hydroxylated  $C_3$ - $C_8$ -cycloalkyl, polyhydroxylated  $C_3$ - $C_8$ -cycloalkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

$R^9$  is hydrogen,  $(C_1$ - $C_3$  alkyl)-CO, or chlorosubstituted  $(C_1$ - $C_3$  alkyl)-CO;

25

W is selected from a branched or straight chain  $C_1$ - $C_6$ -alkyl, cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.2]octanyl;

- n is 1, 2, 3 or 4;  
p is zero or an integer between 1 and 100;  
q is 0 or 1, provided that if p is zero, q is 1;  
5 r is 1, 2 or 3;  
t is 3 or 4;  
u is 0, 1, 2 or 3;

10 or the pharmaceutically acceptable salt or optical isomer thereof.

Examples of compounds which are PSA conjugates include the following:

i)

15

wherein X is:

- AsnLysIleSerTyrGlnSer— (SEQ.ID.NO.: 14),  
AsnLysIleSerTyrGlnSerSer— (SEQ.ID.NO.: 15),  
AsnLysIleSerTyrGlnSerSerSer — (SEQ.ID.NO.:16),  
AsnLysIleSerTyrGlnSerSerSerThr — (SEQ.ID.NO.:17),  
AsnLysIleSerTyrGlnSerSerSerThrGlu — (SEQ.ID.NO.: 18),  
AlaAsnLysIleSerTyrGlnSerSerSerThrGlu — (SEQ.ID.NO.:19),  
Ac—AlaAsnLysIleSerTyrGlnSerSerSerThr— (SEQ.ID.NO.: 20),  
Ac—AlaAsnLysIleSerTyrGlnSerSerSerThrLeu— (SEQ.ID.NO.: 21),  
Ac—AlaAsnLysAlaSerTyrGlnSerAlaSerThrLeu— (SEQ.ID.NO.: 22),  
Ac—AlaAsnLysAlaSerTyrGlnSerAlaSerLeu— (SEQ.ID.NO.: 23),  
Ac—AlaAsnLysAlaSerTyrGlnSerSerSerLeu— (SEQ.ID.NO.: 24),  
Ac—AlaAsnLysAlaSerTyrGlnSerSerLeu— (SEQ.ID.NO.: 25),  
Ac—SerTyrGlnSerSerSerLeu— (SEQ.ID.NO.: 26),  
Ac—hArgTyrGlnSerSerSerLeu— (SEQ.ID.NO.: 27).  
Ac—LysTyrGlnSerSerSerLeu— (SEQ.ID.NO.: 28),  
Ac—LysTyrGlnSerSerNle — (SEQ.ID.NO.: 29),

ii)

(SEQ.ID.NO.: 30),

wherein X is

10

5 or the pharmaceutically acceptable salt or optical isomer thereof.

Compounds which are PSA conjugates and are therefore  
 useful in the present invention, and methods of synthesis thereof, can be  
 found in the following patents, pending applications and publications,  
 10 which are herein incorporated by reference:

US Pat. No. 5,599,686 granted on Feb. 4, 1997;

WO 96/00503 (January 11, 1996); USSN 08/404,833 filed on March 15, 1995;  
 15 USSN 08/468,161 filed on June 6, 1995;

US Pat. No. 5,866,679 granted on Feb. 2, 1999;

WO 98/10651 (March 19, 1998); USSN 08/926,412 filed on September 9,  
 20 1997;

WO 98/18493 (May 7, 1998); US Pat. No. 5,948,750 granted on September 7, 1999;

- 5 USSN 09/112,656 filed on July 9, 1998; USSN 60/052,195 filed on July 10, 1997; and

USSN 09/193,365 filed on November 17, 1998; USSN 60/067,110 filed on December 2, 1997.

10

- Compounds which are described as prodrugs wherein the active therapeutic agent is release by the action of enzymatically active PSA and therefore may be useful in the present invention, and methods of synthesis thereof, can be found in the following patents, pending applications and publications, which are herein incorporated by reference:

WO 98/52966 (November 26, 1998).

- 20 All patents, publications and pending patent applications identified are hereby incorporated by reference.

With respect to the compounds of formulas I-a through VI and VIIIA the following definitions apply:

- The term "alkyl" refers to a monovalent alkane (hydrocarbon) derived radical containing from 1 to 15 carbon atoms unless otherwise defined. It may be straight, branched or cyclic. Preferred straight or branched alkyl groups include methyl, ethyl, propyl, isopropyl, butyl and t-butyl. Preferred cycloalkyl groups include cyclopentyl and cyclohexyl.

- 30 When substituted alkyl is present, this refers to a straight, branched or cyclic alkyl group as defined above, substituted with 1-3 groups as defined with respect to each variable.

- Heteroalkyl refers to an alkyl group having from 2-15 carbon atoms, and interrupted by from 1-4 heteroatoms selected from O, S and N.

The term "alkenyl" refers to a hydrocarbon radical straight, branched or cyclic containing from 2 to 15 carbon atoms and at least one carbon to carbon double bond. Preferably one carbon to carbon double bond is present, and up to four non-aromatic (non-resonating) carbon-carbon double bonds may be present. Examples of alkenyl groups include vinyl, allyl, isopropenyl, pentenyl, hexenyl, heptenyl, cyclopropenyl, cyclobutenyl, cyclopentenyl, cyclohexenyl, 1-propenyl, 2-butenyl, 2-methyl-2-butenyl, isoprenyl, farnesyl, geranyl, geranylgeranyl and the like. Preferred alkenyl groups include ethenyl, propenyl, butenyl and cyclohexenyl. As described above with respect to alkyl, the straight, branched or cyclic portion of the alkenyl group may contain double bonds and may be substituted when a substituted alkenyl group is provided.

The term "alkynyl" refers to a hydrocarbon radical straight, branched or cyclic, containing from 2 to 15 carbon atoms and at least one carbon to carbon triple bond. Up to three carbon-carbon triple bonds may be present. Preferred alkynyl groups include ethynyl, propynyl and butynyl. As described above with respect to alkyl, the straight, branched or cyclic portion of the alkynyl group may contain triple bonds and may be substituted when a substituted alkynyl group is provided.

Aryl refers to aromatic rings e.g., phenyl, substituted phenyl and like groups as well as rings which are fused, e.g., naphthyl and the like. Aryl thus contains at least one ring having at least 6 atoms, with up to two such rings being present, containing up to 10 atoms therein, with alternating (resonating) double bonds between adjacent carbon atoms. The preferred aryl groups are phenyl and naphthyl. Aryl groups may likewise be substituted as defined below. Preferred substituted aryls include phenyl and naphthyl substituted with one or two groups. With regard to the farnesyl transferase inhibitors, "aryl" is intended to include any stable monocyclic, bicyclic or tricyclic carbon ring(s) of up to 7 members in each ring, wherein at least one ring is aromatic. Examples of aryl groups include phenyl, naphthyl, anthracenyl, biphenyl, tetrahydronaphthyl, indanyl, phenanthrenyl and the like.

The term "heteroaryl" refers to a monocyclic aromatic hydrocarbon group having 5 or 6 ring atoms, or a bicyclic aromatic group having 8 to 10 atoms, containing at least one heteroatom, O, S or N, in which a carbon or nitrogen atom is the point of attachment, and in which one additional carbon atom is optionally replaced by a heteroatom selected from O or S, and in which from 1 to 3 additional carbon atoms are optionally replaced by nitrogen heteroatoms. The heteroaryl group is optionally substituted with up to three groups.

Heteroaryl thus includes aromatic and partially aromatic groups which contain one or more heteroatoms. Examples of this type are thiophene, purine, imidazopyridine, pyridine, oxazole, thiazole, oxazine, pyrazole, tetrazole, imidazole, pyridine, pyrimidine, pyrazine and triazine. Examples of partially aromatic groups are tetrahydroimidazo[4,5-c]pyridine, phthalidyl and saccharinyl, as defined below.

With regard to the farnesyl transferase inhibitors, the term heterocycle or heterocyclic, as used herein, represents a stable 5- to 7-membered monocyclic or stable 8- to 11-membered bicyclic or stable 11-15 membered tricyclic heterocycle ring which is either saturated or unsaturated, and which consists of carbon atoms and from one to four heteroatoms selected from the group consisting of N, O, and S, and including any bicyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The heterocyclic ring may be attached at any heteroatom or carbon atom which results in the creation of a stable structure. Examples of such heterocyclic elements include, but are not limited to, azepinyl, benzimidazolyl, benzisoxazolyl, benzofurazanyl, benzopyranyl, benzothiopyranyl, benzofuryl, benzothiazolyl, benzothienyl, benzoxazolyl, chromanyl, cinnolinyl, dihydrobenzofuryl, dihydro-benzothienyl, dihydrobenzothiopyranyl, dihydrobenzothio-pyranyl sulfone, furyl, imidazolidinyl, imidazoliny, imidazolyl, indolinyl, indolyl, isochromanyl, isoindolinyl, isoquinolinyl, isothiazolidinyl, isothiazolyl, isothiazolidinyl, morpholinyl, naphthyridinyl, oxadiazolyl, 2-oxoazepinyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolidinyl, piperidyl, piperazinyl, pyridyl, pyridyl N-oxide, pyridonyl, pyrazinyl, pyrazolidinyl, pyrazolyl, pyrimidinyl, pyrrolidinyl, pyrrolyl, quinazolinyl, quinolinyl, quinolinyl N-oxide,

quinoxaliny, tetrahydrofuryl, tetrahydroisoquinoliny, tetrahydroquinoliny, thiamorpholiny, thiamorpholiny sulfoxide, thiazolyl, thiazoliny, thienofuryl, thienothienyl, and thienyl. Preferably, heterocycle is selected from imidazolyl, 2-oxopyrrolidiny, piperidyl, pyridyl and pyrrolidiny.

With regard to the farnesyl transferase inhibitors, the terms "substituted aryl", "substituted heterocycle" and "substituted cycloalkyl" are intended to include the cyclic group which is substituted with 1 or 2 substituents selected from the group which includes but is not limited to F, Cl, Br, CF<sub>3</sub>, NH<sub>2</sub>, N(C<sub>1</sub>-C<sub>6</sub> alkyl)<sub>2</sub>, NO<sub>2</sub>, CN, (C<sub>1</sub>-C<sub>6</sub> alkyl)O-, -OH, (C<sub>1</sub>-C<sub>6</sub> alkyl)S(O)<sub>m</sub>-, (C<sub>1</sub>-C<sub>6</sub> alkyl)C(O)NH-, H<sub>2</sub>N-C(NH)-, (C<sub>1</sub>-C<sub>6</sub> alkyl)C(O)-, (C<sub>1</sub>-C<sub>6</sub> alkyl)OC(O)-, N<sub>3</sub>-, (C<sub>1</sub>-C<sub>6</sub> alkyl)OC(O)NH- and C<sub>1</sub>-C<sub>20</sub> alkyl.

When R<sup>2</sup> and R<sup>3</sup> are combined to form -(CH<sub>2</sub>)<sub>n</sub>-, cyclic moieties are formed. Examples of such cyclic moieties include, but are not limited to:

In addition, such cyclic moieties may optionally include a heteroatom(s). Examples of such heteroatom-containing cyclic moieties include, but are not limited to:

The term C<sub>4</sub>-C<sub>6</sub> cycloalkyl in the definition of R<sup>1c</sup> wherein two R<sup>1c</sup>s are combined is illustrated by the following:

- The term C<sub>6</sub>-C<sub>10</sub> "multicyclic alkyl ring" in the definition of R<sup>1c</sup>
- 5 wherein two R<sup>1c</sup>s are combined is intended to include polycyclic saturated and unsaturated aliphatic hydrocarbon groups having the specified number of carbon atoms. Examples of such cycloalkyl groups includes, but are not limited to:

The compounds used in the present method may have asymmetric centers and occur as racemates, racemic mixtures, and as individual diastereomers, with all possible isomers, including optical isomers, being included in the present invention. Unless otherwise specified, named amino acids are understood to have the natural "L" stereoconfiguration.

With respect to the farnesyl-protein transferase inhibitors of the formula II, the substituent illustrated by the structure:

- 5 represents a 4, 5, 6 or 7 membered heterocyclic ring which comprises a nitrogen atom through which Q is attached to Y and 0-2 additional heteroatoms selected from N, S and O, and which also comprises a carbonyl, thiocarbonyl,  $-C(=NR^{13})-$  or sulfonyl moiety adjacent to the nitrogen atom attached to Y and includes the following ring systems:

- 15 It is understood that such rings may be substituted by  $R^{6a}$ ,  $R^{6b}$ ,  $R^{6c}$ ,  $R^{6d}$  and/or  $R^{6e}$  as defined hereinabove.

With respect to the farnesyl-protein transferase inhibitors of the formula II, the moiety described as

- 5 where any two of R<sup>6a</sup>, R<sup>6b</sup>, R<sup>6c</sup>, R<sup>6d</sup> and R<sup>6e</sup> on adjacent carbon atoms are combined to form a diradical selected from -CH=CH-CH=CH-, -CH=CH-CH-, -(CH<sub>2</sub>)<sub>4</sub>- and -(CH<sub>2</sub>)<sub>4</sub>- includes, but is not limited to, the following structures:

10

It is understood that such fused ring moieties may be further substituted by the remaining R<sup>6a</sup>, R<sup>6b</sup>, R<sup>6c</sup>, R<sup>6d</sup> and/or R<sup>6e</sup> as defined hereinabove.

15

With respect to the farnesyl-protein transferase inhibitors of the formula II, the substituent illustrated by the structure:

represents a 5, 6 or 7 membered carbocyclic ring wherein from 0 to 3 carbon atoms are replaced by a heteroatom selected from N, S and O, and wherein Y is attached to Q through a carbon atom and includes the following ring systems:

5

10

With respect to the farnesyl-protein transferase inhibitors of the formula III, the substituent illustrated by the structure:

5 represents a 4, 5, 6 or 7 membered heterocyclic ring which comprises a nitrogen atom through which Q is attached to Y and 0-2 additional heteroatoms selected from N, S and O, and which also comprises a carbonyl, thiocarbonyl,  $-C(=NR^{13})-$  or sulfonyl moiety adjacent to the nitrogen atom attached to Y and includes the following ring systems:

10

With respect to the farnesyl-protein transferase inhibitors of the formula III, the substituent illustrated by the structure:

5 represents a 5-, 6- or 7-membered carbocyclic ring wherein from 0 to 3 carbon atoms are replaced by a heteroatom selected from N, S and O, and wherein Y is attached to Q through a carbon atom and includes the following ring systems:

With respect to the farnesyl-protein transferase inhibitors of the formula III, the moiety described as

5

where any two of  $R^{6a}$ ,  $R^{6b}$ ,  $R^{6c}$ ,  $R^{6d}$  and  $R^{6e}$  on adjacent carbon atoms are combined to form a diradical selected from  $-\text{CH}=\text{CH}-\text{CH}=\text{CH}-$ ,  $-\text{CH}=\text{CH}-\text{CH}-$ ,  $-(\text{CH}_2)_4-$  and  $-(\text{CH}_2)_4-$  includes, but is not limited to, the following structures:

10

It is understood that such fused ring moieties may be further substituted by the remaining  $R^{6a}$ ,  $R^{6b}$ ,  $R^{6c}$ ,  $R^{6d}$  and/or  $R^{6e}$  as defined hereinabove.

15

When  $R^2$  and  $R^3$  are combined to form  $-(CH_2)_u-$ , cyclic moieties are formed. Examples of such cyclic moieties include, but are not limited to:

- 5 In addition, such cyclic moieties may optionally include a heteroatom(s). Examples of such heteroatom-containing cyclic moieties include, but are not limited to:

- 10 When  $R^6$  and  $R^7$ ,  $R^7$  and  $R^{7a}$ , or are combined to form  $-(CH_2)_u-$ , cyclic moieties are formed. Examples of such cyclic moieties include, but are not limited to:

- 15 With respect to the compounds of formulas VII through XIV the following definitions apply:

As used herein, "alkyl" and the alkyl portion of aralkyl and similar terms, is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of

carbon atoms; "alkoxy" represents an alkyl group of indicated number of carbon atoms attached through an oxygen bridge.

As used herein, "cycloalkyl" is intended to include non-aromatic cyclic hydrocarbon groups having the specified number of carbon atoms. Examples of cycloalkyl groups include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and the like.

"Halogen" or "halo" as used herein means fluoro, chloro, bromo and iodo.

As used herein, "aryl," and the aryl portion of aralkyl and aroyl, is intended to mean any stable monocyclic or bicyclic carbon ring of up to 7 members in each ring, wherein at least one ring is aromatic. Examples of such aryl elements include phenyl, naphthyl, tetrahydronaphthyl, indanyl, biphenyl, phenanthryl, anthryl or acenaphthyl.

As used herein, the term "hydroxylated" represents substitution on a substitutable carbon of the ring system being so described by a hydroxyl moiety. As used herein, the term "polyhydroxylated" represents substitution on two or more substitutable carbon of the ring system being so described by 2, 3 or 4 hydroxyl moieties.

As used herein, the term "chlorosubstituted C<sub>1</sub>-C<sub>3</sub>-alkyl-CO-" represents a acyl moiety having the designated number of carbon atoms attached to a carbonyl moiety wherein one of the carbon atoms is substituted with a chlorine. Example of such chlorosubstituted elements include but are not limited to chloroacetyl, 2-chloropropionyl, 3-chloropropionyl and 2-chlorobutyroyl.

As used herein, the term "PEG" represents certain polyethylene glycol containing substituents having the designated number of ethyleneoxy subunits. Thus the term PEG(2) represents

and the term PEG(6) represents

- 5 As used herein, the term "(d)(2,3-dihydroxypropionyl)" represents the following structure:

- 10 As used herein, the term "(2R,3S) 2,3,4-trihydroxybutanoyl" represents the following structure:

- 15 As used herein, the term "quinyll" represents the following structure:

- 20 or the diastereomer thereof.

As used herein, the term "cotininyll" represents the following structure:

5

or the diastereomer thereof.

As used herein, the term "gallyl" represents the following structure:

10

As used herein, the term "4-ethoxysquarate" represents the following structure:

15

The structure

represents a cyclic amine moiety having 5 or 6 members in the ring, such a cyclic amine which may be optionally fused to a phenyl or cyclohexyl ring. Examples of such a cyclic amine moiety include, but are not limited to, the following specific structures:

5

The pharmaceutically acceptable salts of the compounds of this invention include the conventional non-toxic salts of the compounds of this invention as formed, e.g., from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those  
 10 derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like: and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenyl-acetic, glutamic, benzoic, salicylic, sulfanilic,  
 15 2-acetoxy-benzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, trifluoroacetic and the like.

It is intended that the definition of any substituent or variable (e.g., R<sup>10</sup>, Z, n, etc.) at a particular location in a molecule be independent of its definitions elsewhere in that molecule. Thus,  
 20 -N(R<sup>10</sup>)<sub>2</sub> represents -NHH, -NHCH<sub>3</sub>, -NHC<sub>2</sub>H<sub>5</sub>, etc. It is understood that substituents and substitution patterns on the compounds of the instant invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art as well as those methods set  
 25 forth below.

The pharmaceutically acceptable salts of the compounds of this invention can be synthesized from the compounds of this invention which contain a basic moiety by conventional chemical methods. Generally, the salts are prepared by reacting the free base with  
 30

stoichiometric amounts or with an excess of the desired salt-forming inorganic or organic acid in a suitable solvent or various combinations of solvents. available N<sub>a</sub>-Z-L-2,3-diaminopropionic acid (Fluka) as a starting material is preferred.

5

Abbreviations used in the description of the chemistry and in the Examples that follow are:

	Ac <sub>2</sub> O	Acetic anhydride;
10	Boc	t-Butoxycarbonyl;
	DBU	1,8-diazabicyclo[5.4.0]undec-7-ene;
	DMAP	4-Dimethylaminopyridine;
	DME	1,2-Dimethoxyethane;
	DMF	Dimethylformamide;
15	EDC	1-(3-dimethylaminopropyl)-3-ethyl-carbodiimide-hydrochloride;
	HOBT	1-Hydroxybenzotriazole hydrate;
	Et <sub>3</sub> N	Triethylamine;
	EtOAc	Ethyl acetate;
20	FAB	Fast atom bombardment;
	HOBT	3-Hydroxy-1,2,2-benzotriazin-4(3H)-one;
	HPLC	High-performance liquid chromatography;
	MCPBA	m-Chloroperoxybenzoic acid;
	MsCl	Methanesulfonyl chloride;
25	NaHMDS	Sodium bis(trimethylsilyl)amide;
	Py	Pyridine;
	TFA	Trifluoroacetic acid;
	THF	Tetrahydrofuran.

30

The compounds are useful in various pharmaceutically acceptable salt forms. The term "pharmaceutically acceptable salt" refers to those salt forms which would be apparent to the pharmaceutical chemist. i.e., those which are substantially non-toxic and which provide the desired pharmacokinetic properties, palatability, absorption, distribution, metabolism or excretion. Other factors, more practical in

35

nature, which are also important in the selection, are cost of the raw materials, ease of crystallization, yield, stability, hygroscopicity and flowability of the resulting bulk drug. Conveniently, pharmaceutical compositions may be prepared from the active ingredients in combination with pharmaceutically acceptable carriers.

Pharmaceutically acceptable salts include conventional non-toxic salts or quarternary ammonium salts formed, e.g., from non-toxic inorganic or organic acids. Non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isethionic, trifluoroacetic and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized by conventional chemical methods. Generally, the salts are prepared by reacting the free base or acid with stoichiometric amounts or with an excess of the desired salt-forming inorganic or organic acid or base, in a suitable solvent or solvent combination.

The farnesyl transferase inhibitors of formula (I-a) through (I-c) can be synthesized in accordance with Schemes 1-16, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. These Schemes and other Schemes that illustrate reactions that may be useful in the preparation of inhibitors of formulae (I-a) through (I-c) are disclosed in U.S. Pat. No. 5,856,326, which is hereby incorporated by reference.

Substituents R, R<sup>a</sup> and R<sup>b</sup>, as shown in the Schemes, represent the substituents R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, and R<sup>5</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting. The compounds referred to in the Synopsis of Schemes 1-16 by Roman numerals are numbered starting sequentially with I and ending with 45.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

5

Synopsis of Schemes 1-16:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures, for the most part. In Scheme 1, for example, the synthesis of 2-alkyl sub-stituted piperazines is outlined, and is essentially that described by J. S. Kiely and S. R. Priebe in Organic Preparations and Proceedings Int., 1990, 22, 761-768. Boc-protected amino acids I, available commercially or by procedures known to those skilled in the art, can be coupled to N-benzyl amino acid esters using a variety of dehydrating agents such as DCC (dicyclohexycarbodiimide) or EDC-HCl (1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride) in a solvent such as methylene chloride, chloroform, dichloroethane, or in dimethylformamide. The product II is then deprotected with acid, for example hydrogen chloride in chloroform or ethyl acetate, or trifluoroacetic acid in methylene chloride, and cyclized under weakly basic conditions to give the diketopiperazine III. Reduction of III with lithium aluminum hydride in refluxing ether gives the piperazine IV, which is protected as the Boc derivative V. The N-benzyl group can be cleaved under standard conditions of hydrogenation, e.g., 10% palladium on carbon at 60 psi hydrogen on a Parr apparatus for 24-48 h. The product VI can be treated with an acid chloride, or a carboxylic acid under standard dehydrating conditions to furnish the carboxamides VII; a final acid deprotection as previously described gives the intermediate VIII (Scheme 2).

The protected piperazine intermediate VII can be reductively alkylated with other aldehydes such as 1-trityl-4-imidazolyl-carboxaldehyde or 1-trityl-4-imidazolylacetaldehyde, to give products such as IX (Scheme 3). The trityl protecting group can be removed from IX to give X, or alternatively, IX can first be treated with an alkyl halide then subsequently deprotected to give the alkylated imidazole XI.

Alternatively, the intermediate VIII can be acylated or sulfonylated by standard techniques. As shown in Scheme 4, the imidazole acetic acid XII can be converted to the acetate XIV by standard procedures, and XIV can be first reacted with an alkyl halide, then treated with refluxing methanol to provide the regiospecifically alkylated imidazole acetic acid ester XV. Hydrolysis and reaction with piperazine VIII in the presence of condensing reagents such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide (EDC) leads to acylated products such as XVII.

Depending on the identity of the amino acid I, various side chains can be incorporated into the piperazine. For example when I is the Boc-protected  $\beta$ -benzyl ester of aspartic acid, the intermediate diketopiperazine XVIII where  $n=1$  and  $R=\text{benzyl}$  is obtained, as shown in Scheme 5. Subsequent lithium aluminum hydride reduction reduces the ester to the alcohol XIX, which can then be reacted with a variety of alkylating agents such as an alkyl iodide, under basic conditions, for example, sodium hydride in dimethylformamide or tetrahydrofuran. The resulting ether XX can then be carried on to final products as described in Schemes 3-4.

N-Aryl piperazines can be prepared as described in Scheme 6. An aryl amine XXI is reacted with *bis*-chloroethyl amine hydrochloride (XXII) in refluxing *n*-butanol to furnish compounds XXIII. The resulting piperazines XXIII can then be carried on to final products as described in Schemes 3-4.

Piperazin-5-ones can be prepared as shown in Scheme 7. Reductive amination of Boc-protected amino aldehyde XXIV (prepared from I as described previously) gives rise to compound XXV. This is then reacted with bromoacetyl bromide under Schotten-Baumann conditions; ring closure is effected with a base such as sodium hydride in a polar aprotic solvent such as dimethylformamide to give XXVI. The carbamate protecting group is removed under acidic conditions such as trifluoroacetic acid in methylene chloride, or hydrogen chloride gas in methanol or ethyl acetate, and the resulting piperazine can then be carried on to final products as described in Schemes 3-4.

The isomeric piperazin-3-ones can be prepared as described in Scheme 8. The imine formed from arylcarboxamides XXVII and 2-

aminoglycinal diethyl acetal (XXVIII) can be reduced under a variety of conditions, including sodium triacetoxyborohydride in dichloroethane, to give the amine XXIX. Amino acids I can be coupled to amines XXIX under standard conditions, and the resulting amide XXX when treated  
5 with aqueous acid in tetrahydrofuran can cyclize to the unsaturated XXXI. Catalytic hydrogenation under standard conditions gives the requisite intermediate XXXII, which is elaborated to final products as described in Schemes 3-4.

Access to alternatively substituted piperazines is described  
10 in Scheme 9. Following deprotection with trifluoroacetic acid, the N-benzyl piperazine V can be acylated with an aryl carboxylic acid. The resulting N-benzyl aryl carboxamide XXXIII can be hydrogenated in the presence of a catalyst to give the piperazine carboxamide XXXIV which can then be carried on to final products as described in Schemes 3-4.

15 The aldehyde XXIV from Scheme 7 can also be reductively alkylated with an aniline as shown in Scheme 10. The product XXXV can be converted to a piperazinone by acylation with chloroacetyl chloride to give XXXVI, followed by base-induced cyclization to XXXVII. Deprotection, followed by reductive alkylation with a protected imidazole  
20 carboxaldehyde leads to XXXVIII, which can be alkylated with an arylmethylhalide to give the imidazolium salt IXL. Final removal of protecting groups by either solvolysis with a lower alkyl alcohol, such as methanol, or treatment with triethylsilane in methylene chloride in the presence of trifluoroacetic acid gives the final product XL.

25 Scheme 11 illustrates the use of an optionally substituted homoserine lactone XLI to prepare a Boc-protected piperazinone XLII. Intermediate XLII may be deprotected and reductively alkylated or acylated as illustrated in the previous Schemes. Alternatively, the hydroxyl moiety of intermediate XLII may be mesylated and displaced by  
30 a suitable nucleophile, such as the sodium salt of ethane thiol, to provide an intermediate XLIII. Intermediate XLII may also be oxidized to provide the carboxylic acid on intermediate XLIV, which can be utilized form an ester or amide moiety.

35 Amino acids of the general formula XLVI which have a sidechain not found in natural amino acids may be prepared by the

reactions illustrated in Scheme 12 starting with the readily prepared imine XLV.

5 Schemes 13-16 illustrate syntheses of suitably substituted aldehydes useful in the syntheses of the instant compounds wherein the variable W is present as a pyridyl moiety. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

The farnesyl transferase inhibitors of formula (II) can be synthesized in accordance with Schemes 17-22, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the

experimental procedures. These Schemes and other Schemes that illustrate reactions that may be useful in the preparation of inhibitors of formula II are disclosed in PCT Publication No. WO 98/29119 (July 9,1998), which is hereby incorporated by reference.

5           Substituents R<sup>3</sup>, R<sup>6</sup> and R<sup>8</sup>, as shown in the Schemes, represent the substituents R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6a</sup>, R<sup>6b</sup>, R<sup>6c</sup>, R<sup>6d</sup>, R<sup>6e</sup> and R<sup>8</sup> as described for formula II; although only one such R<sup>3</sup>, R<sup>6</sup> or R<sup>8</sup> is present in the intermediates and products of the schemes, it is understood that the reactions shown are also applicable when such aryl or heterocyclic  
10           moieties contain multiple substituents. The compounds referred to in the Synopsis of Schemes 17-22 by numerals are numbered starting sequentially with 1 and ending with 16.

          These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize  
15           fragments which are subsequently joined by the alkylation reactions described in the Schemes. Aryl-aryl coupling is generally described in "Comprehensive Organic Functional Group Transformations," Katritzky et al. eds., pp 472-473, Pergamon Press (1995).

20   Synopsis of Schemes 17-22:

          The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures. Schemes 17-22 illustrate synthesis of the instant bicyclic compounds which incorporate a preferred benzylimidazolyl side  
25           chain. Thus, in Scheme 17, for example, a bicyclic intermediate that is not commercially available may be synthesized by methods known in the art. Thus, a suitably substituted pyridinone 1 may be reacted under coupling conditions with a suitably substituted iodobenzyl alcohol to provide the intermediate alcohol 2. The intermediate  
30           alcohol 2 may converted to the corresponding bromide 3. The bromide 3 may be coupled to a suitably substituted benzylimidazolyl 4 to provide, after deprotection, the instant compound 5.

          Schemes 18-20 illustrate methods of synthesizing related or analogous key alcohol intermediates, which can then be processed  
35           as described in Scheme 17. Thus, Scheme 18 illustrates pyridinonyl-

pyridyl alcohol forming reactions starting with the suitably substituted idonicotinate **6**.

Scheme 19 illustrates preparation of the intermediate alcohol **9** wherein the terminal lactam ring is saturated. Acylation of  
5 a suitably substituted 4-aminobenzyl alcohol **7** with a suitably substituted brominated acyl chloride provides the bisacylated intermediate **8**. Closure of the lactam ring followed by saponification of the remaining acyl group provides the intermediate alcohol. Preparation of the homologous saturated lactam **10** is illustrated in  
10 Scheme 20.

Scheme 21 illustrates synthesis of an instant compound wherein a non-hydrogen  $R^{9b}$  is incorporated in the instant compound. Thus, a readily available 4-substituted imidazole **11** may be selectively iodinated to provide the 5-iodoimidazole **12**. That  
15 imidazole may then be protected and coupled to a suitably substituted benzyl moiety to provide intermediate **13**. Intermediate **13** can then undergo the alkylation reactions that were described hereinabove.

Compounds of the instant invention wherein the  $A^1(CR^1_2)_nA^2(CR^1_2)_n$  linker is a substituted methylene may be  
20 synthesized by the methods shown in Scheme 22. Thus, the N-protected imidazolyl iodide **14** is reacted, under Grignard conditions with a suitably protected benzaldehyde to provide the alcohol **15**. Acylation, followed by the alkylation procedure illustrated in the Schemes above (in particular, Scheme 17) provides the instant  
25 compound **16**. If other  $R^1$  substituents are desired, the acetyl moiety can be manipulated as illustrated in the Scheme.

Other suitably substituted aldehydes such as those described in Schemes 13-16 hereinabove may be utilized in the syntheses of the instant compounds of the formula II. Similar  
30 synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

The farnesyl transferase inhibitors of formula (III) can be synthesized in accordance with Schemes 23-24, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. These Schemes and other Schemes that illustrate reactions that may be useful in the preparation of inhibitors of formula III are disclosed in PCT Publication No. WO 98/28980 (July 9, 1998), which is hereby incorporated by reference.

Substituents R<sup>3</sup>, R<sup>6</sup> and R<sup>8</sup>, as shown in the Schemes, represent the substituents R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6a</sup>, R<sup>6b</sup>, R<sup>6c</sup>, R<sup>6d</sup>, R<sup>6e</sup> and R<sup>8</sup> as described for formula III; although only one such R<sup>3</sup>, R<sup>6</sup> or R<sup>8</sup> is present in the intermediates and products of the schemes, it is understood that the reactions shown are also applicable when such aryl or heterocyclic moieties contain multiple substituents. The compounds referred to in the Synopsis of Schemes 23-24 by numerals are numbered starting sequentially with 17 and ending with 22.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes. The reactions described in the Schemes are illustrative only and are not meant to be limiting. Other reactions useful in the preparation of heteroaryl moieties are described in "Comprehensive Organic Chemistry, Volume 4: Heterocyclic Compounds" ed. P.G. Sammes, Oxford (1979) and references therein.

#### Synopsis of Schemes 23-24:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures. Schemes 23-24 illustrate synthesis of the instant bicyclic compounds which incorporate a preferred benzylimidazolyl side-chain. Thus, in Scheme 23, for example, a bicyclic intermediate that is not commercially available may be synthesized by methods known in the art. Thus, a suitably substituted pyridinonyl alcohol 18 may be synthesized starting from the corresponding isonicotinate 17 according to procedures described by Boekelhiede and Lehn (*J. Org. Chem.*, 26:428-430 (1961)). The alcohol is then protected and reacted under Ullmann coupling conditions with a suitably substituted phenyl iodide, to provide the intermediate bicyclic alcohol 19. The intermediate alcohol 19 may be converted to the corresponding bromide 20. The bromide 20 may be coupled to a suitably substituted

benzylimidazolyl **21** to provide, after deprotection, the instant compound **22**.

5 Scheme 24 illustrates methods of synthesizing related halide intermediates, which can then be processed as described in Scheme 23. Thus, Scheme 24 illustrates preparation of a pyridylpyridinonyl halide and thienylpyridinonyl halide starting with the suitably substituted halogenated heterocycles.

## SCHEME 24

- 5 The farnesyl transferase inhibitors of formula (IV) can be synthesized in accordance with Schemes 25-46, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the

experimental procedures. Substituents R, R<sup>a</sup>, R<sup>b</sup> and R<sup>sub</sup>, as shown in the Schemes, represent the substituents R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, and R<sup>5</sup>, and substituents on Z<sup>1</sup> and Z<sup>2</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting. The compounds referred to in the Synopsis of Schemes 25-46 by Roman numerals are numbered starting sequentially with I and ending with XLVI.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

#### Synopsis of Schemes 25-46:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures. In Scheme 25, for example, the synthesis of macrocyclic compounds of the instant invention containing suitably substituted piperazines and the preferred benzylimidazolyl moiety is outlined. Preparation of the substituted piperazine intermediate is essentially that described by J. S. Kiely and S. R. Priebe in Organic Preparations and Proceedings Int., 1990, 22, 761-768. Boc-protected amino acids I, available commercially or by procedures known to those skilled in the art, can be coupled to N-benzyl amino acid esters using a variety of dehydrating agents such as DCC (dicyclohexycarbodiimide) or EDC·HCl (1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride) in a solvent such as methylene chloride, chloroform, dichloroethane, or in dimethylformamide. The product II is then deprotected with acid, for example hydrogen chloride in chloroform or ethyl acetate, or trifluoroacetic acid in methylene chloride, and cyclized under weakly basic conditions to give the diketopiperazine III. Reduction of III with lithium aluminum hydride in refluxing ether gives the piperazine IV, which may then be deprotected by catalytic reduction to provide intermediate V. Intermediate V may then be coupled to intermediate VII, prepared from 4-imidazolylacetic acid VI in several steps as illustrated. Once the amide bond is formed to yield the intermediate

VIII, cesium carbonate nucleophilic aromatic substitution reaction conditions result in an intramolecular cyclization to yield compound IX of the instant invention. This cyclization reaction depends on the presence of an electronic withdrawing moiety (such as nitro, cyano, and the like) either ortho or para to the fluorine atom.

Scheme 26 illustrates the synthesis of instant compounds wherein an amido bond is formed between the piperazine nitrogen and the linker to the Y group. Thus, the protected piperazine X is coupled to a naphthoic acid having a suitably positioned benzyloxy moiety.

Consecutive removal of the Boc and benzyl protecting groups provided intermediate XI, which may be coupled to a suitably substituted 1-benzylimidazole aldehyde XII to give intermediate XIII. Intramolecular cyclization takes place as previously described using the cesium carbonate conditions to provide instant compound XIV.

Scheme 27 illustrates the preparation of instant compounds which incorporate a piperazinone moiety in the macrocyclic ring. Thus the suitably substituted benzyloxybenzyl mesylate XV is reacted with a 4-protected 2-piperazinone XVI to provide the 1-benzyl-2-piperazinone intermediate XVII. Intermediate XVII is doubly deprotected in the presence of Boc anhydride to provide the N-Boc protected piperazinone, which is deprotected to give intermediate XVIII. Reductive N-alkylation of intermediate XVIII with a suitably substituted 1-benzylimidazole aldehyde XII provides intermediate XIX, which can undergo intramolecular cyclization under the cesium carbonate conditions to give compound XX of the instant invention.

Synthesis of compounds of the invention characterized by direct attachment of an aryl moiety to the piperazinone moiety and incorporation of a third aromatic carbocyclic moiety into the macrocycle is illustrated in Scheme 28. A benzyloxyphenoxyaniline XIII, prepared in three steps from a suitably substituted 2-benzyloxyphenol XXI and a suitably substituted nitrochlorobenzene XXII, is reacted with chloroacetyl chloride to provide intermediate XXIV. Intermediate XXIV is reacted with a suitably substituted ethanolamine and the resulting amido alcohol cyclized to form the piperazinone moiety of intermediate XXV. Intermediate XXV is reductively alkylated as described in

Schemes 26 and 27 to provide intermediate XXVI. Deprotection, followed by intramolecular cyclization provides compound XXVII of the instant invention.

5 Scheme 29 illustrates expansion of the macrocyclic ring to a "18-membered" system by utilizing a suitably substituted 3-benzyloxyphenol XXVIII in the place of the 2-benzyloxyphenol XXI. Scheme 29 also illustrates the use of a reduced amino acid (such as methioninol) to provide substitution specifically at the 5-position of the piperazinone moiety.

10 Scheme 30 illustrates that the synthetic strategy of building the piperazinone onto a alcoholic aromatic amine can also be utilized to prepare compounds of the instant invention wherein a naphthyl group forms part of the macrocyclic backbone.

15 Scheme 31 illustrates the synthetic strategy that is employed when the R<sup>8</sup> substituent is not an electronic withdrawing moiety either ortho or para to the fluorine atom. In the absence of the electronic withdrawing moiety, the intramolecular cyclization can be accomplished via an Ullmann reaction. Thus, the imidazolylmethyl-acetate XXXII is treated with a suitably substituted halobenzylbromide to  
20 provide the 1-benzylimidazolyl intermediate XXXIII. The acetate functionality of intermediate XXXIII was converted to an aldehyde which was then reductively coupled to intermediate XVIII, prepared as illustrated in Scheme 27. Coupling under standard Ullmann conditions provided compound XXXIV of the instant invention.

25 Illustrative examples of the preparation of compounds of the instant invention that incorporate a 2,5-diketopiperazine moiety and a 2,3-diketopiperazine moiety are shown in Schemes 32-33 and Schemes 34-35 respectively.

30 Scheme 36 illustrates the manipulation of a functional group on a side chain of an intermediate 2,5-diketopiperazine. The side chain of intermediate IIIa, obtained as illustrated in Scheme 29 from protected aspartic acid, may be comprehensively reduced and reprotected to afford intermediate XXXV, which can deprotected or can be alkylated first followed by deprotection to provide intermediate IVa

having an ether sidechain. The intermediate IVa can be incorporated into the reaction sequence illustrated in Scheme 25.

Scheme 37 illustrates direct preparation of a symmetrically substituted piperazine intermediate from a suitably substituted aniline (such as intermediate XXIII from Scheme 28) and a suitably substituted *bis*-(chloroethyl)amine XXXVII. The intermediate XXXVIII can be utilized in the reaction sequence illustrated in Scheme 25 to produce compound IXL of the instant invention

Preparation of a substituted piperazinone intermediate XVIIIa starting from a readily available N-protected amino acid XL is illustrated in Scheme 38.

Scheme 39 illustrates preparation of an intermediate piperazinone compound XLI having a substituent at the 3-position that is derived from the starting protected amino acid XL.

Incorporation of a spirocyclic moiety (for example, when R<sup>2</sup> and R<sup>3</sup> are combined to form a ring) is illustrated in Scheme 40.

Scheme 41 illustrates the use of an optionally substituted homoserine lactone XLII to prepare a Boc-protected piperazinone XLIII. Intermediate XLIII may be deprotected and reductively alkylated or acylated as illustrated in the previous Schemes. Alternatively, the hydroxyl moiety of intermediate XLIII may be mesylated and displaced by a suitable nucleophile, such as the sodium salt of ethane thiol, to provide an intermediate XLIV. Intermediate XLIII may also be oxidized to provide the carboxylic acid on intermediate XLV, which can be utilized form an ester or amide moiety.

Amino acids of the general formula XL which have a sidechain not found in natural amino acids may be prepared by the reactions illustrated in Scheme 42 starting with the readily prepared imine XLVI.

Other suitably substituted aldehydes such as those described in Schemes 43-46 hereinabove may be utilized in the syntheses of the instant compounds of the formula IV wherein the moiety "W" is a pyridyl. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

- 5 The farnesyl transferase inhibitors of formula (V) can be synthesized in accordance with Schemes 47-51, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. Substituents R, R<sup>a</sup>, R<sup>b</sup> and R<sup>sub</sup>, as shown in

the Schemes, represent the substituents R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, and R<sup>5</sup>, and substituents on Z<sup>1</sup> and Z<sup>2</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting. The compounds referred to in the Synopsis of Schemes 47-51 by Roman numerals are  
5 numbered starting sequentially with I and ending with XX.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

10

Synopsis of Schemes 47-51:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures. In Scheme 47, for example, the synthesis of a key  
15 intermediate in the preparation of macrocyclic compounds of the instant invention containing the preferred benzylimidazolyl moiety is outlined. A suitably substituted fluorotoluene I is brominated and reacted with an imidazolylmethyl acetate to form the intermediate II. Reduction, followed by oxidation provided the aldehyde III which is then  
20 reductively alkylated with a suitably substituted amine to provide the intermediate IV.

Scheme 48 illustrates the synthesis of a compound of the instant invention which utilizes intermediate IV. Thus, a suitably substituted hydroxyaniline V is N-protected, for example with by  
25 reductive alkylation with 2,4-dimethoxybenzaldehyde, and the resulting secondary amine is reacted with a suitably substituted chloroacetyl chloride to provide intermediate VI. Intermediate VI is then reacted with the imidazolylmethylamine IV to provide the protected amide VII. Intermediate VII may then undergo a cesium carbonate nucleophilic  
30 aromatic substitution reaction resulting in an intramolecular cyclization to yield compound VIII of the instant invention. This cyclization reaction depends on the presence of an electronic withdrawing moiety (such as nitro, cyano, and the like) either ortho or para to the fluorine atom. Compound VIII may be N-deprotected to

provide instant compound IX, which may itself be further elaborated, for example by boronic acid coupling to give compound X of the instant invention.

5       Syntheses of compounds of the instant invention wherein the linker "X" is an ether linkage are illustrated in Scheme 49. Thus, the protected amide VI is reacted with a suitably substituted sodium benzylimidazolyl methoxide to provide intermediate XI, intramolecular cyclization as previously described, followed by deprotection provides the instant compound XII, which can be further elaborated as shown.

10       Scheme 50 illustrates syntheses of instant compounds wherein the linker "X" is an amido linkage. Thus, the primary amine XIII, homologous to intermediate IV is reacted with a suitably substituted bromoacetyl bromide, followed by a reaction with a nucleophile, such as a suitably substituted O-protected hydroxythiophenol. The  
15       resulting intermediate XIV is deprotected and intramolecular cyclization as previously described provides compound XV of the instant invention. The sulfur moiety in compound XV also may be oxidized to provide instant compound XVI.

20       Scheme 51 illustrates the synthetic strategy that is employed when the R<sup>8</sup> substituent is not an electronic withdrawing moiety either ortho or para to the fluorine atom. In the absence of the electronic withdrawing moiety, the intramolecular cyclization can be accomplished via an Ullmann reaction. Thus, the previously described aldehyde III can be converted to the homologous amine XVII. Amine  
25       XVII is then reacted with the previously described chloroacetamide VI to provide intermediate XVIII. Intramolecular cyclization may then be affected under Ullmann reaction to provide intermediate XIX, which may be deprotected and reduced to provide the diamino macrocycle of the instant invention XX.

30       Schemes 43-46 hereinabove illustrate syntheses of suitably substituted aldehydes useful in the syntheses of the instant compounds wherein the variable W is present as a pyridyl moiety. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art.

- 5 The farnesyl transferase inhibitors of formula (VI) can be synthesized in accordance with Schemes 52-57, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. Substituents R,  $R^a$ ,  $R^b$  and  $R^{sub}$ , as shown in the Schemes, represent the substituents  $R^2$ ,  $R^3$ ,  $R^4$ , and  $R^5$ , and

substituents on Z<sup>1</sup> and Z<sup>2</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting. The compounds referred to in the Synopsis of Schemes 52-57 by Roman numerals are numbered starting sequentially with I and ending with XVIII.

5                   These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

10   Synopsis of Schemes 52-57:

                  The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures. For example, syntheses of instant compounds wherein the linker "X" is an sulfonamido linkage is illustrated in Scheme 52. Thus,  
15   a suitably substituted benzylimidazolyl containing amine I is prepared as illustrated. A suitably substituted benzyl alcohol II is converted to the corresponding benzylsulfinylchloride III. Reaction of intermediate III with the primary amine I provides the sulfinamido intermediate IV. That intermediate can be oxidized to the sulfonamide, the alcohol moiety  
20   can then be deprotected and previously described intramolecular cyclization provides compound V of the instant invention.

                  Instant compounds wherein the variable "V" is other than a phenyl moiety can be prepared as illustrated in Scheme 53. Thus, a suitably substituted fluoronaphthylmethyl bromide VII may be reacted  
25   with an imidazolyl alkylacetate to provide intermediate VIII. The alcohol moiety of intermediate VIII can be deprotected and then reacted with a suitably substituted phenyl isocyanate to provide the carbamate IX, which may then be optionally N-alkylated, followed by deprotection and intramolecular cyclization to provide compound XI of the instant  
30   invention.

                  Synthesis of compounds of the instant invention wherein variables "Z<sup>1</sup>" and "Z<sup>2</sup>" are both phenyl moieties and the linker "X" is a amido moiety is illustrated in Scheme 54. Scheme 55 illustrates preparation of the corresponding instant compound wherein linker "X"

is a urea moiety by reacting the isocyanate derived from intermediate I and the phenoxyaniline XIII described in Scheme 54. Synthesis of compounds of the instant invention wherein variable "Z" is a naphthyl moiety and the linker "X" is an amido moiety is illustrated in Scheme 56.

5               Scheme 57 illustrates the synthetic strategy that is employed when the R<sup>8</sup> substituent is not an electronic withdrawing moiety either ortho or para to the fluorine atom. In the absence of the electronic withdrawing moiety, the intramolecular cyclization can be accomplished via an Ullmann reaction. Thus, the aldehyde XIV can be  
10 converted to the homologous amine XV. Amine XV is then reacted with the previously described benzyloxybenzoic acid XVI to provide intermediate XVII. Intramolecular cyclization may then be affected under Ullmann reaction conditions to provide the amido macrocycle of the instant invention XVIII.

15               Other suitably substituted aldehydes such as those described in Schemes 43-46 hereinabove may be utilized in the syntheses of the instant compounds of the formula VI wherein the moiety "W" is pyridyl. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W  
20 are also well known in the art.

5                   The prenyl transferase inhibitors of formula (VII) can be synthesized in accordance with Schemes 58-66, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. The compounds referred to in the Synopsis of

10 Schemes 58-66 by Roman numerals are numbered starting sequentially with II and ending with XXXX.

                  These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions

15 described in the Schemes.

### Synopsis of Schemes 58-66

Schemes 58-66 describe the synthesis of compounds of formulae VII. The starting materials can be obtained from commercial sources or they can be obtained using standard transformations (e.g. esterification of the hydroxy acid) from commercially available materials.

In Scheme 58, amino-hydroxybenzoates of type II can be converted to the corresponding iodide III by treatment with acidic aqueous  $\text{NaNO}_2$  followed by the addition of KI. The phenol may then be alkylated by treatment with a base such as NaH or  $\text{Cs}_2\text{CO}_3$  in an organic solvent (for example DMF) followed by the addition of an electrophile to yield IV. Reduction of the ester of IV using, for example,  $\text{LiBH}_4$  in THF then yields the alcohol V which can in turn be treated with  $\text{Zn}(\text{CN})_2$  in DMF and a palladium catalyst to give VI. The alcohol of VI can be converted into a leaving group of VII in a number of ways. One such procedure involves reaction of the alcohol with a sulfonyl chloride in the presence of an organic base (e.g. triethylamine) in an organic solvent such as dichloromethane. A second method requires the reaction of the alcohol with  $\text{CBr}_4$  and a phosphine such as triphenyl phosphine in an organic solvent such as dichloromethane. A third method involves reaction of the alcohol with N-bromosuccinimide and dimethyl sulfide in dichloromethane. The reaction of VII with imidazole in a polar solvent such as DMF then affords compounds of formula IA. In addition, VII upon reaction with 4-iodo-1-tritylimidazole in THF with 1,2-dibromoethane, Zn and  $\text{NiCl}_2(\text{PPh}_3)_2$  and subsequent methanolysis may yield compounds of formula IB.

Scheme 59 shows an alternative route for the conversion of III into VI employing chemical transformations described above.

In Scheme 60, the phenol X can be converted to the corresponding triflate XI using trifluoromethane sulfonic anhydride in an organic solvent such as dichloromethane with an organic base such as triethylamine. The triflate may then be converted to the nitrile XII, the ester reduced to XIII and the alcohol transformed to a leaving group as shown in XIV using previously described reactions. Treatment of XIV as above would then produce compounds of formula IC or ID.

An alternative route for the synthesis of compounds of formula IA and IB is given in Scheme 61. Methyl-hydroxybenzoic acids of structure XV may be bis alkylated by treatment with a base such as NaH or Cs<sub>2</sub>CO<sub>3</sub> in an organic solvent (for example DMF) followed by the  
5 addition of an electrophile to yield XVI saponification using aqueous hydroxide then affords the acid XVII. Acid XVII is then converted to the primary amide XIX via the acid chloride XVIII (prepared with thionyl chloride in a solvent such as toluene then a reaction with ammonia in, for example, chloroform). Treatment of XIX with thionyl  
10 chloride in DMF results in the nitrile XX which can be brominated at the benzylic position using, for example, N-bromosuccinimide and benzoyl peroxide in carbon tetrachloride. Transformations, as before, then yield IA or IB.

An alternative route for the synthesis of compounds of formula IA and IB is shown in Scheme 62 which incorporates the  
15 reaction steps described above but alters the order of these transformations to give XXIV which is converted to IA by treatment with a halide or mesylate.

Two routes to compounds containing a diaryl ether linkage as illustrated in XXVII are described in Scheme 85. The bromo fluoride  
20 XXV is transformed to the fluoro nitrile with zinc cyanide, then converted to ID in a series of transformations described in previous schemes.

Scheme 64 illustrates yet another route for the synthesis of  
25 compounds of formula IA.

Schemes 65 and 66 describe routes for the preparation of compounds XXXIX and XXXX which contain a heteroatom at the benzylic position between W and the phenyl ring of IA.

R'' independently represents R<sup>13</sup> or its protected precursors thereof;

R''' independently represents the following moiety:

15

The farnesyl transferase inhibitors of formula (VIII) can be synthesized in accordance with Schemes 67-73, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. The compounds referred to in the Synopsis of Schemes 67-73 by Roman numerals are numbered starting sequentially with II and ending with XXX.

20

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

25

#### Synopsis of Schemes 67-73

Schemes 67-73 describe the synthesis of compounds of formula VIII. The starting materials can be obtained from commercial

sources or they can be obtained using standard transformations (e.g. esterification of the hydroxy acid) from commercially available materials.

In Scheme 67, amino-hydroxybenzoates of type I can be converted to the corresponding iodide II by treatment with acidic aqueous  $\text{NaNO}_2$  followed by the addition of KI. The phenol may then be alkylated by treatment with a base such as NaH or  $\text{Cs}_2\text{CO}_3$  in an organic solvent (for example DMF) followed by the addition of an electrophile to yield III. Reduction of the ester of III using, for example,  $\text{LiBH}_4$  in THF then yields the alcohol IV which can in turn be treated with  $\text{Zn}(\text{CN})_2$  in DMF and a palladium catalyst to give V. The alcohol of V can be converted into a leaving group of VI in a number of ways. One such procedure involves reaction of the alcohol with a sulfonyl chloride in the presence of an organic base (e.g. triethylamine) in an organic solvent such as dichloromethane. A second method requires the reaction of the alcohol with  $\text{CBr}_4$  and a phosphine such as triphenyl phosphine in an organic solvent such as dichloromethane. A third method involves reaction of the alcohol with N-bromosuccinimide and dimethyl sulfide in dichloromethane. The reaction of VI with imidazole in a polar solvent such as DMF then affords compounds of formula VII. In addition, VI upon reaction with 4-iodo-1-tritylimidazole in THF with 1,2-dibromoethane, Zn and  $\text{NiCl}_2(\text{PPh}_3)_2$  gives a compound of formula VIII. Subsequent methanolysis of VIII may yield compounds of formula IX. Treating a compound of formula VIII with a suitably substituted alkyl or aralkyl halide or mesylate, followed by methanolysis yields a compound of formula X.

An alternative route for the synthesis of compounds of formula VII is shown in Scheme 68. Iodo-hydroxybenzoic acids of structure II may be converted to the corresponding cyano XI. The ester may be reduced by treating XI with  $\text{LiBH}_4$  (and THF) to produce the alcohol XII. The alcohol can be converted into a leaving group by reacting the alcohol with  $\text{CBr}_4$  and a phosphine, such as triphenyl phosphine (in an organic solvent such as dichloromethane). The reaction of XIII with imidazole affords XIV, which can be converted to

VII by treatment with a suitably substituted alkyl or aralkyl halide or mesylate.

Scheme 69 illustrates one route for the synthesis of compounds of formula XXI. The bromotoluene XV can be treated with  
5  $\text{KMnO}_4$  to yield the bromo-fluorobenzoic acid XVI. The acid can be reduced with treatment of XVI with  $\text{BH}_3$  in THF to give the bromobenzene XVII. The bromobenzene XVII can be converted to the corresponding cyanobenzene XVIII by treating XVII with  $\text{Zn}(\text{CN})_2$  and a palladium catalyst. The alcohol of intermediate XVIII can be  
10 converted into a leaving group by reacting the alcohol with NBS and DMS to produce XIX. Treatment of XIX with a nitrogen-containing heterocycle yields XX. Compounds of formula XXI can be obtained by treating XX with  $\text{CsCO}_3$  or  $\text{KF/Alumina}$  and a phenol.

Schemes 70 and 71 describe routes for the preparation of  
15 compounds XXVI and XXVII wherein  $\text{R}^c$  is a non-hydrogen substituent.

Schemes 72 and 73 illustrate the synthesis of compounds of formula XXIX and XXX, using techniques previously described above.

## SCHEME 72

## SCHEME 73

In Schemes 67-73, it is understood that:

R independently represents an alkyl or an aryl;

5

R<sup>a</sup> independently represents R<sup>2</sup> or protected precursors thereof;

R<sup>b</sup> independently represents the following moiety:

10

R<sup>c</sup> independently represents R<sup>1c</sup> or protected precursors thereof; and

R<sup>d</sup> independently represents R<sup>1</sup> or protected precursors thereof.

15

The prenyl transferase inhibitors of formula (VII) can be synthesized in accordance with Schemes 74-90, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. The compounds referred to in the Synopsis of Schemes 74-90 by Roman numerals are numbered starting sequentially with II and ending with LII.

Reactions used to generate the compounds of this invention are prepared by employing reactions as shown in the Schemes 74-90, in

25

addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures. Substituents R, R<sup>a</sup> and R<sup>b</sup>, as shown in the Schemes, represent the substituents R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup>; however their point of attachment to the ring is illustrative only and is not meant to be limiting. Substituent Z', as shown in the Schemes, represents the substituent Z as defined hereinabove or a protected precursor thereof.

These reactions may be employed in a linear sequence to provide the compounds of the invention or they may be used to synthesize fragments which are subsequently joined by the alkylation reactions described in the Schemes.

#### Synopsis of Schemes 74-90:

The requisite intermediates are in some cases commercially available, or can be prepared according to literature procedures, for the most part. In Scheme 74, for example, the synthesis of N-protected substituted piperazines is outlined. Boc-protected amino acids I, available commercially or by procedures known to those skilled in the art, can be coupled to N-benzyl amino acid esters using a variety of dehydrating agents such as DCC (dicyclohexylcarbodiimide) or EDC·HCl (1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride) in a solvent such as methylene chloride, chloroform, dichloroethane, or dimethylformamide. The product II is then deprotected with acid, for example hydrogen chloride in chloroform or ethyl acetate, or trifluoroacetic acid in methylene chloride, and cyclized under weakly basic conditions to give the diketopiperazine III. Reduction of III with lithium aluminum hydride in a refluxing ether gives the piperazine IV, which is protected as the Boc derivative V. The N-benzyl group can be cleaved under standard conditions of hydrogenation, e.g., 10% palladium on carbon at 60 psi hydrogen on a Parr apparatus for 24-48 h. The product VI can be reacted with a suitably substituted carboxylic acid to provide the piperazine VII (Scheme 75); a final acid deprotection as previously described gives the intermediate VIII (Scheme 75). The intermediate VIII can itself be reductively alkylated with a variety of

aldehydes, such as IX. The aldehydes can be prepared by standard procedures, such as that described by O. P. Goel, U. Krolls, M. Stier and S. Kesten in Organic Syntheses, 1988, 67, 69-75, from the appropriate amino acid (Scheme 76). The reductive alkylation can be accomplished  
5 at pH 5-7 with a variety of reducing agents, such as sodium triacetoxyborohydride or sodium cyanoborohydride in a solvent such as dichloroethane, methanol or dimethylformamide. The product X can be deprotected to give the final compounds XI with trifluoroacetic acid in methylene chloride. The final product XI is isolated in the salt form, for  
10 example, as a trifluoroacetate, hydrochloride or acetate salt, among others. The product diamine XI can further be selectively protected to obtain XII, which can subsequently be reductively alkylated with a second aldehyde to obtain XIII. Removal of the protecting group, and conversion to cyclized products such as the dihydroimidazole XV can be  
15 accomplished by literature procedures.

As shown in Scheme 77, the piperazine intermediate VIII can be reductively alkylated with other aldehydes such as 1-trityl-4-imidazolyl-carboxaldehyde or 1-trityl-4-imidazolylacetaldehyde, to give products such as XVI. The trityl protecting group can be removed from  
20 XVI to give XVII, or alternatively, XVI can first be treated with an alkyl halide then subsequently deprotected to give the alkylated imidazole XVIII. Alternatively, the intermediate VIII can be acylated or sulfonylated by standard techniques.

Incorporation of a hydroxyl moiety on the sidechain carbon  
25 alpha to the amide carbonyl of compounds of the formula XVIII can be accomplished as illustrated in Scheme 78. A suitably substituted primary alcohol XIX undergoes a one carbon homologation, via a Swern oxidation, nitrile addition and hydrolysis, to provide the substituted hydroxyacetic acid XX. The trifluoromethyl ketal is formed and reacted  
30 with the previously described protected piperazine VI to provide, following deprotection, the intermediate XXI. Intermediate XXI can undergo a variety of reactions at its unsubstituted nitrogen. For example, treatment of XXI with a suitably substituted imidazolylmethyl halide to provide the instant compound XXII.

Scheme 79 illustrates incorporation of an arylalkoxycarbonyl or heteroarylalkoxycarbonyl moiety onto the piperazine nitrogen. Thus a suitably substituted alcohol XXIII is reacted with nitrophenylchloroformate to provide the intermediate XXIV, which is reacted with a suitably substituted piperazine to provide the instant compound XXV. An analogous reaction sequence alternatively provides the corresponding aminocarbonyl substitution on the piperazine nitrogen, as shown in Scheme 80.

Scheme 81 illustrates the preparation of compounds analogous to compound XXXI wherein the alcohol utilized in the first step is a suitably substituted phenol. The scheme also illustrates the incorporation of an indole moiety for the substituent W in place of the preferred benzylimidazolyl moiety.

Scheme 82 illustrates synthesis of an instant compound wherein a non-hydrogen  $R^{9b}$  is incorporated in the instant compound. Thus, a readily available 4-substituted imidazole XXVI may be selectively iodinated to provide the 5-iodoimidazole XXVII. That imidazole may then be protected and coupled to a suitably substituted benzyl moiety to provide intermediate XXVIII. Attachment of the imidazolyl nitrogen via an ethyl linker to the piperazine nitrogen of intermediate XXI, described above, provides the instant compound XXIX.

Compounds of the instant invention wherein the  $A^1(CR^{1a}_2)_nA^2(CR^{1a}_2)_n$  linker is oxygen may be synthesized by methods known in the art, for example as shown in Scheme 83. The suitably substituted phenol XXX may be reacted with methyl N-(cyano)methanimidate to provide the 4-phenoxyimidazole XXXI. After selective protection of one of the imidazolyl nitrogens, the intermediate XXXII can undergo alkylation reactions as described for the benzylimidazoles in Scheme 81.

If the piperazine VIII is reductively alkylated with an aldehyde which also has a protected hydroxyl group, such as XXXIII in Scheme 84, the protecting groups can be subsequently removed to unmask the hydroxyl group. The Boc protected amino alcohol XXXIV

can then be utilized to synthesize 2-aziridinylmethylpiperazines such as XXXV.

Reaction Scheme 85 provides an illustrative example of the synthesis of compounds of the instant invention wherein the substituents  $R^2$  and  $R^3$  are combined to form  $-(CH_2)_u-$ . For example, 1-aminocyclohexane-1-carboxylic acid XLV can be converted to the spiropiperazine XLVI essentially according to the procedures outlined in Schemes 74 and 75. The piperazine intermediate XLVI can be deprotected as before, and carried on to final products as described in Schemes 76-82. It is understood that reagents utilized to provide the imidazolylalkyl substituent may be readily replaced by other reagents well known in the art and readily available to provide other N-substituents on the piperazine.

Amino acids of the general formula LI which have a sidechain not found in natural amino acids may be prepared by the reactions illustrated in Scheme 86 starting with the readily prepared imine LII.

Other suitably substituted aldehydes such as those described in Schemes 13-16 hereinabove may be utilized in the syntheses of the instant compounds of the formula VIIIA. Similar synthetic strategies for preparing alkanols that incorporate other heterocyclic moieties for variable W are also well known in the art. For example, Scheme 87 illustrates the preparation of the corresponding quinoline aldehyde.

Scheme 88 depicts a general method for synthesizing a key intermediate useful in the preparation of preferred embodiments of the instant invention wherein V is phenyl and W is imidazole. A piperazine moiety can be readily added to this benzyl-imidazole intermediate as set forth in Scheme 89.

Attachment of the N-terminus of the oligopeptide to vinblastine is illustrated (S.P. Kandukuri et al. J. Med. Chem. 28:1079-1088 (1985)).

10 Scheme 96 illustrates preparation of conjugates of the oligopeptides of the instant invention and the vinca alkaloid cytotoxic agent vinblastine wherein the attachment of vinblastine is at the C-

terminus of the oligopeptide. The use of the 1,3-diaminopropane linker is illustrative only; other spacer units between the carbonyl of vinblastine and the C-terminus of the oligopeptide are also envisioned.

Furthermore, Scheme 96 illustrates a synthesis of conjugates wherein  
5 the C-4-position hydroxy moiety is reacetylated following the addition of the linker unit. Applicants have discovered that the desacetyl vinblastine conjugate is also efficacious and may be prepared by eliminating the steps shown in Scheme 80 of protecting the primary amine of the linker and reacting the intermediate with acetic anhydride,  
10 followed by deprotection of the amine. Conjugation of the oligopeptide at other positions and functional groups of vinblastine may be readily accomplished by one of ordinary skill in the art and is also expected to provide compounds useful in the treatment of prostate cancer.

## SCHEME 95

## SCHEME 95 (Continued)

## SCHEME 96

SCHEME 96 (Continued)

The PSA conjugates of formula XI and XII can be synthesized in accordance with Schemes 97-101, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures.

## SCHEME 97

## SCHEME 98

SCHEME 99

## SCHEME 100

## SCHEME 101

Scheme 102 illustrates preparation of PSA conjugates of the formula XIV wherein the attachment of vinblastine is at the C-terminus of the oligopeptide. Furthermore, Scheme 102 illustrates a synthesis of conjugates wherein the C-4-position hydroxy moiety is reacylated following the addition of the linker unit. Applicants have discovered that the desacetyl vinblastine conjugate is also efficacious and may be prepared by eliminating the steps shown in Scheme 102 of protecting the primary amine of the linker and reacting the intermediate with acetic anhydride, followed by deprotection of the amine. Conjugation of the oligopeptide at other positions and functional groups of vinblastine may be readily accomplished by one of ordinary skill in the art and is also expected to provide compounds useful in the treatment of prostate cancer.

## SCHEME 102

## SCHEME 102 (continued)

The PSA conjugates of formula XV can be synthesized in accordance with Schemes 103-104, in addition to other standard manipulations such as ester hydrolysis, cleavage of protecting groups, etc., as may be known in the literature or exemplified in the experimental procedures.

Reaction Scheme 103 illustrates preparation of conjugates of the oligopeptides of the instant invention and the vinca alkaloid cytotoxic agent vinblastine wherein the attachment of the oxygen of the 4-desacetylvinblastine is at the C-terminus of the oligopeptide. While other sequences of reactions may be useful in forming such conjugates, it has been found that initial attachment of a single amino acid to the 4-oxygen and subsequent attachment of the remaining oligopeptide sequence to that amino acid is a preferred method. It has also been found that 3,4-dihydro-3-hydroxy-4-oxo-1,2,3-benzotriazine (ODHBT) may be utilized in place of HOAt in the final coupling step.

Reaction Scheme 104 illustrates preparation of conjugates of the oligopeptides of the instant invention wherein a hydroxy alkanolyl acid is used as a linker between the vinca drug and the oligopeptide.

## EXAMPLES

Examples provided are intended to assist in a further understanding of the invention. Particular materials employed, species  
5 and conditions are intended to be further illustrative of the invention and not limitative of the reasonable scope thereof.

The standard workup referred to in the examples refers to solvent extraction and washing the organic solution with 10% citric acid, 10% sodium bicarbonate and brine as appropriate. Solutions were dried  
10 over sodium sulfate and evaporated in vacuo on a rotary evaporator.

### EXAMPLE 1

(S)-1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-imidazolymethyl]-5-[2-(methanesulfonyl)ethyl]-2-piperazinone dihydrochloride  
15

Step A:     1-triphenylmethyl-4-(hydroxymethyl)-imidazole

To a solution of 4-(hydroxymethyl)imidazole hydrochloride (35.0 g, 260 mmol) in 250 mL of dry DMF at room temperature was added triethylamine (90.6 mL, 650 mmol). A white solid precipitated from the  
20 solution. Chlorotriphenylmethane (76.1 g, 273 mmol) in 500 mL of DMF was added dropwise. The reaction mixture was stirred for 20 hours, poured over ice, filtered, and washed with ice water. The resulting product was slurried with cold dioxane, filtered, and dried *in vacuo* to provide the titled product as a white solid which was sufficiently pure for  
25 use in the next step.

Step B:     1-triphenylmethyl-4-(acetoxymethyl)-imidazole

Alcohol from Step A (260 mmol, prepared above) was suspended in 500 mL of pyridine. Acetic anhydride (74 mL, 780 mmol)  
30 was added dropwise, and the reaction was stirred for 48 hours during which it became homogeneous. The solution was poured into 2 L of EtOAc, washed with water (3 x 1 L), 5% aq. HCl soln. (2 x 1 L), sat. aq. NaHCO<sub>3</sub>, and brine, then dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the crude product. The acetate was isolated as a white  
35 powder which was sufficiently pure for use in the next reaction.

Step C:      1-(4-cyanobenzyl)-5-(acetoxymethyl)-imidazole  
hydrobromide

A solution of the product from Step B (85.8 g, 225 mmol) and  
5 a-bromo-*p*-tolunitrile (50.1 g, 232 mmol) in 500 mL of EtOAc was stirred  
at 60°C for 20 hours, during which a pale yellow precipitate formed. The  
reaction was cooled to room temperature and filtered to provide the solid  
imidazolium bromide salt. The filtrate was concentrated *in vacuo* to a  
10 volume 200 mL, reheated at 60°C for two hours, cooled to room tempera-  
ture, and filtered again. The filtrate was concentrated *in vacuo* to a  
volume 100 mL, reheated at 60°C for another two hours, cooled to room  
temperature, and concentrated *in vacuo* to provide a pale yellow solid.  
All of the solid material was combined, dissolved in 500 mL of methanol,  
15 and warmed to 60°C. After two hours, the solution was reconcentrated  
*in vacuo* to provide a white solid which was triturated with hexane to  
remove soluble materials. Removal of residual solvents *in vacuo*  
provided the titled product hydrobromide as a white solid which was  
used in the next step without further purification.

20 Step D:      1-(4-cyanobenzyl)-5-(hydroxymethyl)-imidazole

To a solution of the acetate from Step C (50.4 g, 150 mmol) in  
1.5 L of 3:1 THF/water at 0 °C was added lithium hydroxide monohydrate  
(18.9 g, 450 mmol). After one hour, the reaction was concentrated *in*  
*vacuo*, diluted with EtOAc (3 L), and washed with water, sat. aq.  
25 NaHCO<sub>3</sub> and brine. The solution was then dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and  
concentrated *in vacuo* to provide the crude product as a pale yellow fluffy  
solid which was sufficiently pure for use in the next step without further  
purification.

30 Step E:      1-(4-cyanobenzyl)-5-imidazolecarboxaldehyde

To a solution of the alcohol from Step D (21.5 g, 101 mmol) in  
500 mL of DMSO at room temperature was added triethylamine (56 mL,  
402 mmol), then SO<sub>3</sub>-pyridine complex (40.5 g, 254 mmol). After 45  
minutes, the reaction was poured into 2.5 L of EtOAc, washed with  
35 water (4 x 1 L) and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in*

*vacuo* to provide the aldehyde as a white powder which was sufficiently pure for use in the next step without further purification.

Step F:      (S)-2-(tert-butoxycarbonylamino)-N-methoxy-N-methyl-4-(methylthio)butanamide

5                      L-N-Boc-methionine (30.0 g, 0.120 mol), *N,O*-dimethylhydroxylamine hydrochloride (14.1 g, 0.144 mol), EDC hydrochloride (27.7 g, 0.144 mol) and HOBT (19.5 g, 0.144 mol) were stirred in dry DMF (300 mL) at 20°C under nitrogen. More *N,O*-dimethylhydroxylamine  
10 hydrochloride (2.3 g, 23 mmol) was added to obtain pH 7-8. The reaction was stirred overnight, the DMF distilled to half the original volume under high vacuum, and the residue partitioned between ethyl acetate and sat. NaHCO<sub>3</sub> soln. The organic phase was washed with saturated  
15 sodium bicarbonate, water, 10% citric acid, and brine, and dried with sodium sulfate. The solvent was removed *in vacuo* to give the title compound.

Step G:      (S)-2-(tert-butoxycarbonylamino)-4-(methylthio)butanal

20                      A suspension of lithium aluminum hydride (5.02 g, 0.132 mol) in ether (500 mL) was stirred at room temperature for one hour. The solution was cooled to -50°C under nitrogen, and a solution of the product from Step F (39.8 g, ca. 0.120 mol) in ether (200 mL) was added over 30 min, maintaining the temperature below -40°C. When the addition was complete, the reaction was warmed to 5°C, then recooled to  
25 -45°C. Analysis by tlc revealed incomplete reaction. The solution was rewarmed to 5°C, stirred for 30 minutes, then cooled to -50°C. A solution of potassium hydrogen sulfate (72 g, 0.529 mol) in 200 mL water was slowly added, maintaining the temperature below -20°C. The mixture was wasmed to 5°C, filtered through Celite, and concentrated *in vacuo* to  
30 provide the title aldehyde.

Step H:      (S)-2-(tert-butoxycarbonylamino)-N-(3-chlorophenyl)-4-(methylthio)butanamine

35                      To a solution of 3-chloroaniline (10.3 mL, 97.4 mmol), the product from Step G (23.9 g, 97.4 mmol), and acetic acid (27.8 mL, 487

mmol) in dichloroethane (250 mL) under nitrogen was added sodium triacetoxyborohydride (41.3 g, 195 mmol). The reaction was stirred overnight, then quenched with saturated sodium bicarbonate solution. The solution was diluted with  $\text{CHCl}_3$ , and the organic phase was

- 5 washed with water, 10% citric acid and brine. The solution was dried over sodium sulfate and concentrated *in vacuo* to provide the crude product (34.8 g) which was chromatographed on silica gel with 20% ethyl acetate in hexane to obtain the title compound .

10 Step I: (S)-4-(*tert*-butoxycarbonyl)-1-(3-chlorophenyl)-5-[2-(methylthio)ethyl]piperazin-2-one

- A solution of the product from Step H (22.0 g, 63.8 mmol) in ethyl acetate (150 mL) was vigorously stirred at 0°C with saturated sodium bicarbonate (150 mL). Chloroacetyl chloride (5.6 mL, 70.2 mmol)  
15 was added dropwise, and the reaction stirred at 0°C for 2h. The layers were separated, and the ethyl acetate phase was washed with 10% citric acid and saturated brine, and dried over sodium sulfate. After concentration *in vacuo*, the resulting crude product (27.6 g) was dissolved in DMF (300 mL) and cooled to 0°C under argon. Cesium  
20 carbonate (63.9 g, 196 mmol) was added, and the reaction was stirred for two days, allowing it to warm to room temperature. Another portion of cesium carbonate (10 g, 30 mmol) was added, and the reaction was stirred for 16 hours. The DMF was distilled *in vacuo*, and the residue partitioned between ethyl acetate and water. The organic phase was  
25 washed with saturated brine, and dried over sodium sulfate. The crude product was chromatographed on silica gel with 20-25% ethyl acetate in hexane to obtain the title compound.

30 Step J: (S)-4-(*tert*-butoxycarbonyl)-1-(3-chlorophenyl)-5-[2-(methanesulfonyl)ethyl]piperazin-2-one

- A solution of the product from Step I (14.2 g, 37 mmol) in methanol (300 mL) was cooled to 0°C, and a solution of magnesium monoperoxyphthalate (54.9 g, 111 mmol) in 210 mL MeOH was added over 20 minutes. The ice bath was removed, and the solution was  
35 allowed to warm to room temperature. After 45 minutes, the reaction

was concentrated *in vacuo* to half the original volume, then quenched by the addition of 2N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln. The solution was poured into EtOAc and sat NaHCO<sub>3</sub> solution, and the organic layer was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the crude sulfone. This material was chromatographed on silica gel with 60-100% ethyl acetate in hexane to obtain the titled compound.

Step K: (S)-1-(3-chlorophenyl)-5-[2-(methanesulfonyl)ethyl]  
piperazin-2-one

Through a solution of Boc-protected piperazinone from Step J (1.39 g, 3.33 mmol) in 30 mL of EtOAc at 0°C was bubbled anhydrous HCl gas. The saturated solution was stirred for 35 minutes, then concentrated *in vacuo* to provide the hydrochloride salt as a white powder. This material was suspended in EtOAc and treated with dilute aqueous NaHCO<sub>3</sub> solution. The aqueous phase was extracted with EtOAc, and the combined organic mixture was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The resulting amine was reconcentrated from toluene to provide the titled material suitable for use in the next step.

Step L: (S)-1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)imidazolyl-methyl]-5-[2-(methanesulfonyl)-ethyl]-2-piperazinone  
dihydrochloride

To a solution of the amine from Step K (898 mg, 2.83 mmol) and imidazole carboxaldehyde from Step E (897 mg, 4.25 mmol) in 15 mL of 1,2-dichloroethane was added sodium triacetoxyborohydride (1.21 g, 5.7 mmol). The reaction was stirred for 23 hours, then quenched at 0°C with sat. NaHCO<sub>3</sub> solution. The solution was poured into CHCl<sub>3</sub>, and the aqueous layer was back-extracted with CHCl<sub>3</sub>. The combined organics were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The resulting product was purified by silica gel chromatography (95:5:0.5-90:10:0 EtOAc:MeOH:NH<sub>4</sub>Cl), and the resultant product was taken up in EtOAc/methanol and treated with 2.1 equivalents of 1 M HCl/ether solution. After concentrated *in vacuo*, the product dihydrochloride was isolated as a white powder.

EXAMPLE 2

1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)imidazolyl-methyl]-2-piperazinone  
dihydrochloride

---

5

Step A:      N-(3-chlorophenyl)ethylenediamine hydrochloride

To a solution of 3-chloroaniline (30.0 mL, 284 mmol) in 500 mL of dichloromethane at 0°C was added dropwise a solution of 4 N HCl in 1,4-dioxane (80 mL, 320 mmol HCl). The solution was warmed to room temperature, then concentrated to dryness *in vacuo* to provide a white powder. A mixture of this powder with 2-oxazolidinone (24.6 g, 282 mmol) was heated under nitrogen atmosphere at 160°C for 10 hours, during which the solids melted, and gas evolution was observed. The reaction was allowed to cool, forming the crude diamine hydrochloride salt as a pale brown solid.

15

Step B:      N-(tert-butoxycarbonyl)-N'-(3-chlorophenyl)  
ethylenediamine

---

The amine hydrochloride from Step A (*ca.* 282 mmol, crude material prepared above) was taken up in 500 mL of THF and 500 mL of sat. aq. NaHCO<sub>3</sub> soln., cooled to 0°C, and di-*tert*-butylpyrocarbonate (61.6 g, 282 mmol) was added. After 30 h, the reaction was poured into EtOAc, washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the titled carbamate as a brown oil which was used in the next step without further purification.

20

25

Step C:      N-[2-(tert-butoxycarbamoyl)ethyl]-N-(3-chlorophenyl)-2-chloroacetamide

---

A solution of the product from Step B (77 g, *ca.* 282 mmol) and triethylamine (67 mL, 480 mmol) in 500 mL of CH<sub>2</sub>Cl<sub>2</sub> was cooled to 0°C. Chloroacetyl chloride (25.5 mL, 320 mmol) was added dropwise, and the reaction was maintained at 0°C with stirring. After 3 h, another portion of chloroacetyl chloride (3.0 mL) was added dropwise. After 30 min, the reaction was poured into EtOAc (2 L) and washed with water, sat. aq. NH<sub>4</sub>Cl soln., sat. aq. NaHCO<sub>3</sub> soln., and brine. The solution was

30

35

dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the chloroacetamide as a brown oil which was used in the next step without further purification.

5    Step D:        4-(tert-butoxycarbonyl)-1-(3-chlorophenyl)-2-piperazinone

To a solution of the chloroacetamide from Step C (ca. 282 mmol) in 700 mL of dry DMF was added K<sub>2</sub>CO<sub>3</sub> (88 g, 0.64 mol). The solution was heated in an oil bath at 70-75°C for 20 hours, cooled to room temperature, and concentrated *in vacuo* to remove ca. 500 mL of DMF.

- 10    The remaining material was poured into 33% EtOAc/hexane, washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the product as a brown oil. This material was purified by silica gel chromatography (25-50% EtOAc/hexane) to yield pure product, along with a sample of product (ca. 65% pure by HPLC)
- 15    containing a less polar impurity.

Step E:        1-(3-chlorophenyl)-2-piperazinone

- Through a solution of Boc-protected piperazinone from Step D (17.19 g, 55.4 mmol) in 500 mL of EtOAc at -78°C was bubbled
- 20    anhydrous HCl gas. The saturated solution was warmed to 0°C, and stirred for 12 hours. Nitrogen gas was bubbled through the reaction to remove excess HCl, and the mixture was warmed to room temperature. The solution was concentrated *in vacuo* to provide the hydrochloride as a white powder. This material was taken up in 300 mL of CH<sub>2</sub>Cl<sub>2</sub> and
- 25    treated with dilute aqueous NaHCO<sub>3</sub> solution. The aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub> (8 x 300 mL) until tlc analysis indicated complete extraction. The combined organic mixture was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the titled free amine as a pale brown oil.

30

Step F:        1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)imidazolylmethyl]-2-piperazinone dihydrochloride

To a solution of the amine from Step E (55.4 mmol, prepared above) in 200 mL of 1,2-dichloroethane at 0°C was added 4Å powdered

molecular sieves (10 g), followed by sodium triacetoxyborohydride (17.7 g, 83.3 mmol). The imidazole carboxaldehyde from Step E of Example 4 (11.9 g, 56.4 mmol) was added, and the reaction was stirred at 0°C. After 26 hours, the reaction was poured into EtOAc, washed with dilute aq. NaHCO<sub>3</sub>, and the aqueous layer was back-extracted with EtOAc. The combined organics were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The resulting product was taken up in 500 mL of 5:1 benzene:CH<sub>2</sub>Cl<sub>2</sub>, and propyl-amine (20 mL) was added. The mixture was stirred for 12 hours, then concentrated *in vacuo* to afford a pale yellow foam. This material was purified by silica gel chromatography (2-7% MeOH/CH<sub>2</sub>Cl<sub>2</sub>), and the resultant white foam was taken up in CH<sub>2</sub>Cl<sub>2</sub> and treated with 2.1 equivalents of 1 M HCl/ether solution. After concentrated *in vacuo*, the product dihydrochloride was isolated as a white powder.

#### EXAMPLE 2A

1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)imidazolyl-methyl]-2-piperazinone hydrochloride (Compound A)

Step 1: Preparation of p-Cyanobenzylamine • H<sub>3</sub>PO<sub>4</sub> salt

A slurry of HMTA in 2.5 L EtOH was added gradually over about 30 min to about 60 min to a stirred slurry of cyanobenzyl-bromide in 3.5 L EtOH and maintained at about 48-53 °C with heating & cooling in a 22L neck flask (small exotherm). Then the transfer of HMTA to the reaction mixture was completed with the use of 1.0 L EtOH. The reaction mixture was heated to about 68-73 °C and aged at about 68-73 °C for about 90 min. The reaction mixture was a slurry containing a granular precipitate which quickly settled when stirring stopped.

The mixture was cooled to a temperature of about 50 °C to about 55 °C. Propionic acid was added to the mixture and the mixture was heated and maintained at a temperature of about 50 °C to about 55 °C. Phosphoric acid was gradually added over about 5 min to about 10 min, maintaining the reaction mixture below about 65 °C to form a precipitate-containing mixture. Then the mixture was gradually warmed to about 65 °C to about 70 °C over about 30 min and aged at about 65 °C to about 70 °C for about 30 min. The mixture was then gradually cooled to about 20-25 °C over about 1 hour and aged at about 20-25 °C for about 1 hour.

The reaction slurry was then filtered. The filter cake was washed four times with EtOH, using the following sequence, 2.5 L each time. The filter cake was then washed with water five times, using 300 mL each time. Finally, the filter cake was washed twice with MeCN (1.0 L each time) and the above titled compound was obtained.

Step 2:      Preparation of 1-(4-Cyanobenzyl)-2-Mercapto-5-Hydroxymethylimidazole

---

7% water in acetonitrile (50 mL) was added to a 250 mL roundbottom flask. Next, an amine phosphate salt (12.49 g), prepared as described in Step 1, was added to the flask. Next potassium thiocyanate (6.04 g) and dihydroxyacetone (5.61 g) was added. Lastly, propionic acid (10.0 mL) was added. Acetonitrile/water 93:7 (25 mL) was used to rinse down the sides of the flask. This mixture was then heated to 60 °C, aged for about 30 minutes and seeded with 1% thioimidazole. The mixture was then aged for about 1.5 to about 2 hours at 60 °C. Next, the mixture was heated to 70 °C, and aged for 2 hours. The temperature of the mixture was then cooled to room temperature and was aged overnight.

The thioimidazole product was obtained by vacuum filtration. The filter cake was washed four times acetonitrile (25 mL each time) until the filtrates became nearly colorless. Then the filter cake was washed three times with water (approximately 25-50 mL each time) and dried in vacuo to obtain the above-identified compound.

Step 3: Preparation of 1-(4-Cyanobenzyl)-5-Hydroxymethylimidazole

A 1L flask with cooling/heating jacket and glass stirrer (Lab-Max) was charged with water (200 mL) at 25 °C. The thioimidazole (90.27 g), prepared as described in Step 2, was added, followed by acetic acid (120 mL) and water (50 mL) to form a pale pink slurry. The reaction was warmed to 40 °C over 10 minutes. Hydrogen peroxide (90.0 g) was added slowly over 2 hours by automatic pump maintaining a temperature of 35-45 °C. The temperature was lowered to 25 °C and the solution aged for 1 hour.

The solution was cooled to 20 °C and quenched by slowly adding 20% aqueous Na<sub>2</sub>SO<sub>3</sub> (25 mL) maintaining the temperature at less than 25 °C. The solution was filtered through a bed of DARCO G-60 (9.0 g) over a bed of SolkaFlok (1.9 g) in a sintered glass funnel. The bed was washed with 25 mL of 10% acetic acid in water.

The combined filtrates were cooled to 15 °C and a 25% aqueous ammonia was added over a 30 minute period, maintaining the temperature below 25 °C, to a pH of 9.3. The yellowish slurry was aged overnight at 23 °C (room temperature). The solids were isolated via vacuum filtration. The cake (100 mL wet volume) was washed with 2 x 250 mL 5% ammonia (25%) in water, followed by 100 mL of ethyl acetate.

The wet cake was dried with vacuum/N<sub>2</sub> flow and the above-titled compound was obtained.

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>): δ 7.84-7.72 (d, 2H), 7.31-7.28 (d, 2H), 6.85 (s, 1H), 5.34 (s, 2H), 5.14-5.11 (t, 1H), 4.30-4.28 (d, 2H), 3.35 (s, 1H).

5

Step 4: Preparation of 1-(4-cyanobenzyl)-5-chloromethyl imidazole  
HCl salt

10 1-(4-Cyanobenzyl)-5-hydroxymethylimidazole (1.0 kg), prepared as described in above in Step 3, was slurried with DMF (4.8 L) at 22 °C and then cooled to -5 °C. Thionyl chloride (390 mL) was added dropwise over 60 min during which time the reaction temperature rose to a maximum of 9 °C. The solution became nearly homogeneous before the product began to precipitate from solution. The slurry was warmed  
15 to 26 °C and aged for 1 h.

The slurry was then cooled to 5 °C and 2-propanol (120 mL) was added dropwise, followed by the addition of ethyl acetate (4.8 L). The slurry was aged at 5 °C for 1 h before the solids were isolated and washed with chilled ethyl acetate (3 x 1 L). The product was dried in vacuo at 40  
20 °C overnight to provide the above-titled compound.

<sup>1</sup>H NMR (250 MHz DMSO-d<sub>6</sub>): δ 9.44 (s, 1H), 7.89 (d, 2H, 8.3 Hz), 7.89 (s, 1H), 7.55 (d, 2H, 8.3 Hz), 5.70 (s, 2H), 4.93 (s, 2H). <sup>13</sup>C NMR (75.5 MHz DMSO-d<sub>6</sub>): δ<sub>c</sub> 139.7, 137.7, 132.7, 130.1, 128.8, 120.7, 118.4, 111.2, 48.9, 33.1.

Step 5: Preparation of 1-(4-Cyanobenzyl)-5-Chloromethyl Imidazole HCl salt via addition of Hydroxymethylimidazole to Vilsmeier Reagent

---

- 5 To an ice cold solution of dry acetonitrile (3.2 L, 15 L/Kg hydroxymethylimidazole) was added 99% oxalyl chloride (101 mL, 1.15 mol, 1.15 equiv.), followed by dry DMF (178 mL, 2.30 mol, 2.30 equiv.), at which time vigorous evolution of gas was observed. After stirring for about 5 to 10 min following the addition of DMF, solid
- 10 hydroxymethylimidazole (213 g, 1.00 mol), as described above in Example 7, was added gradually. After the addition, the internal temperature was allowed to warm to a temperature of about 23 °C to about 25 °C and stirred for about 1 to 3 hours. The mixture was filtered, then washed with dry acetonitrile (400 mL displacement wash, 550 mL slurry wash,
- 15 and a 400 mL displacement wash). The solid was maintained under a N<sub>2</sub> atmosphere during the filtration and washing to prevent hydrolysis of the chloride by adventitious H<sub>2</sub>O. This yielded approximately 93 to about 96% crystalline form of the chloromethylimidazole hydrochloride.
- 20 <sup>1</sup>H NMR (250 MHz DMSO-d<sub>6</sub>): δ 9.44 (s, 1H), 7.89 (d, 2H, 8.3 Hz), 7.89 (s, 1H), 7.55 (d, 2H, 8.3 Hz), 5.70 (s, 2H), 4.93 (s, 2H). <sup>13</sup>C NMR (75.5 MHz DMSO-d<sub>6</sub>): δ<sub>c</sub> 139.7, 137.7, 132.7, 130.1, 128.8, 120.7, 118.4, 111.2, 48.9, 33.1.

Step 6: Synthesis of the Amide Alcohol (1)

(1)

At 22 °C, 3-chloroaniline (50.0 g) was combined with 460 ml isopropyl acetate and 20% aqueous potassium bicarbonate (72.5 g dissolved in 290 ml water). The biphasic mixture was cooled to 5 °C and chloroacetyl chloride (42 ml) was added dropwise over 30 minutes, keeping the internal temperature below 10 °C. The reaction mixture was warmed to 22 °C over 30 min. The aqueous layer was removed at 22°C and ethanolamine (92 ml) was added rapidly. The reaction mixture was warmed to 55°C over 30 minutes and aged for 1 hour. At 55 °C, 140 ml water was added with 30 ml isopropyl acetate to the reaction mixture. The biphasic reaction mixture was agitated for 15 minutes at 55°C. The layers were allowed to settle and the aqueous layer was removed. The organic layer was cooled to 45 °C and seed was added. The mixture was cooled to 0 °C over 1 hour and aged for 1 hour. The solids were filtered and washed with chilled isopropyl acetate (2 x 75 ml). The solids were dried in vacuo at 40 °C for 18 hours to provide about an 83.5% yield of the amide alcohol (1).

<sup>1</sup>H NMR (300 MHz; DMSO-d<sub>6</sub>) δ 7.85 (t, 1H 2.0 Hz), 7.52 (m, 1H), 7.32 (t, 1H, 8.0 Hz), 4.5-4.8 (br s, 1H), 3.47 (t, 1H, 5.5 Hz), 3.30 (s, 1H), 2.60 (t, 1H 5.0 Hz).

<sup>13</sup>C NMR (75.4 MHz; DMSO-d<sub>6</sub>) δ<sub>c</sub> 170.9, 140.1, 133.0, 130.3, 122.8 118.5, 117.5, 60.3, 52.7, 51.5.

Step 7:      Synthesis of 1-(3-Chlorophenyl)-2-Piperazinone  
Hydrochloride with DIAD

58 mL of EtOAc was charged to an N<sub>2</sub>-purged flask.

- 5    Tributylphosphine (28.3 mL, 113.8 mmol) was added, via syringe, and the solution was cooled to about -10°C. DIAD (22.4 mL, 113.8 mmol) was added dropwise over 30 minutes, maintaining the temperature at < 0 °C. The above mixture was cannulated into a slurry of an amide alcohol (20.0 g, 87.5 mmol), prepared as described above in Step 6, in 117 mL
- 10   EtOAc over 20 minutes, maintaining the temperature at < 0 °C. The reaction was warmed to room temperature over 25 minutes. 99% conversion was observed by LC assay. Water (0.55 mL) was then added, and the reaction was warmed to 40 °C. The solution was seeded with 200 mg of authentic material, and 1.0 eq. HCl (4.0 N in abs. EtOH) was added
- 15   dropwise over 2 hours. The slurry was cooled to 0 °C over 2 hours and aged at 0 °C for 1 hour. The mixture was filtered, and the cake was washed with chilled EtOAc (3x16 mL). The cake was dried in vacuo overnight at 40 °C to afford about a 77% yield of the above-titled compound.

20

Step 8:      Preparation of 1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-2-piperazinone • H<sub>2</sub>O (Crystal Form I)

- 25    A 50 L four-neck flask, equipped with a mechanical stirrer, cooling bath, teflon-coated thermocouple, and nitrogen inlet was charged with 4.0 L of acetonitrile. Then 4-cyanobenzyl-

chloromethylimidazole hydrochloride (958 g, 3.36 mol), prepared as described in Step 4, piperazinone hydrochloride (883 g, 3.54 mol), prepared as described in Step 7, and the remaining 1.25 L of acetonitrile were added to the flask at room temperature. Diisopropylethylamine (1.99 L, 11.4 mol) was added to the mixture. The bulk of the solid dissolved immediately upon addition of diisopropylethylamine, leaving a slightly turbid solution.

After stirring 30 min, the solution was cooled to 0 °C over 60 min. The solution was stirred 26 h at 0 °C, then warmed to 20 °C over 20 min. Water (2 L) was added to the slightly turbid solution over 20 min. Authentic seed was added to 8 L of water, which was subsequently added to the solution over 70 min. Additional water (17 L) was added over 90 min, and the mixture was aged 60 min thereafter. The temperature throughout the addition and aging was from about 20°C to about 22 °C. The mixture was filtered through a polypropylene filter pot. The crystals were washed with 1:5 acetonitrile/water. The crystalline solid was dried by passage of nitrogen through the filter cake (36 h) to provide the above-titled compound.

<sup>13</sup>C NMR (62.9 MHz, CDCl<sub>3</sub>): δ 165.2, 142.7, 142.1, 139.4, 134.8, 133.0, 131.0, 130.2, 127.3, 127.1, 126.3, 126.0, 123.9, 118.1, 112.0, 57.7, 50.6, 49.9, 148.8, 148.3.

Step 9: Preparation of 1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-2-piperazinone•HCl

An IPA/toluene mixture (7 L) is made up as a 69:31 wt% ratio by mixing IPA (3.90 Kg, 4.97 L) and toluene(1.76 Kg, 2.03 L).

A pre-weighed 1 L graduated cylinder was charged with IPA (500 mL, 392 g). The cylinder was cooled to 0 °C. Gaseous HCl was bubbled into the IPA until a volume change of roughly +80 mL was

observed. The new weight of the cylinder and its contents indicated that 140 g HCl (3.84 moles) had been charged, making up a 6.62 M solution (or 7.22 molal solution). An aliquot (500 mL, 458 g) was transferred to a 5 L flask. To this solution was added toluene (192 mL, 166 g) and the 5 - 69:31 IPA/toluene mixture (2.07 Liters, 1.7 Kg).

A 22 L flask was charged with the free base form of 1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-2-piperazinone, prepared as described above in Step 8. The 69:31 IPA/toluene mixture (11.0 L) was added to this flask, which resulted in dissolution of the solid. 10 The solution was heated to 40 °C. The hot solution was filtered through an in-line filter into a pre-heated (40 °C) 22 L flask. The dissolution flask was further washed with the 69:31 IPA/toluene solution (0.5 L), which was transferred to the crystallization flask through the in-line filter. The in-line filter was replaced with a 4 L addition funnel.

15 The 1.21 M HCl solution (1.93 L, 1.63 Kg, 2.34 moles, 0.99 equiv.) was charged to the addition funnel. A fraction of the HCl solution (0.19 Liters, 0.23 moles, 0.10 equiv.) was added to the solution of free base over 10 min, whereupon the solution was seeded. After aging the thin slurry for 10-15 min, the remaining HCl solution was added 20 over 2 h. The thick mixture was cooled to -10 °C over 2 h, aged for 30 min, then filtered. The crystals were washed with ice-cold 69:31 IPA/toluene and was then washed three times with ice-cold IPA. The crystals were dried under vacuum with a nitrogen stream and the above-titled compound was obtained.

25

### EXAMPLE 3

4-[1-(5-Chloro-2-oxo-2H-[1,2']bipyridinyl-5'-ylmethyl)-1H-pyrrol-2-ylmethyl]-benzonitrile

---

30 Step 1:     5-Chloro-5'-methyl-[1,2']bipyridinyl-2-one  
5-Chloro-2-pyridinol (2.26g, 17.4 mmol), 2-bromo-5-methylpyridine (3.00g, 17.4 mmol), copper (0.022g, 0.35 mmol) and K<sub>2</sub>CO<sub>3</sub> (2.66g, 19.2 mmol) were heated at 180°C for 16 hrs. The brown reaction mixture was cooled, diluted with EtOAc and washed with 35 saturated NaHCO<sub>3</sub>. The aqueous layer was extracted with EtOAc (2x)

and the combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated in vacuo. The residue was chromatographed (silica gel, EtOAc: CH<sub>2</sub>Cl<sub>2</sub> 20:80 to 50:50 gradient elution) to afford the title compound as a white solid.

- 5 <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 8.37 (s, 1H), 7.96(d, J=3.0Hz, 1H), 7.83 (d, J=8.4Hz, 1H), 7.65(dd, J=2.4 and 8.2Hz, 1H), 7.32(dd, J=2.9 and 9.7 Hz, 1H), 6.61(d, J=9.7Hz, 1H) and 2.39(s,3H)ppm.

Step 2: 5'-Bromomethyl-5-chloro-[1,2']bipyridinyl-2-one

- 10 A solution of the pyridine from Step 1(1.00g, 4.53 mmol), N-bromosuccinimide (0.81g, 4.53 mmol) and AIBN (0.030g, 0.18 mmol) in CCl<sub>4</sub> (40mL) was heated at reflux for 2 hrs. The solids were filtered and the filtrate collected. The solvent was evaporated in vacuo and the residue chromatographed (silica gel, EtOAc: CH<sub>2</sub>Cl<sub>2</sub> 25:75 to 50:50  
15 gradient elution) to afford the title bromide.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 8.55 (s, 1H), 8.04( d, J= 2.9 Hz, 1H), 8.01 (d, J=8.4Hz, 1H), 7.88 (dd, J=2.4 and 8.6Hz, 1H), 7.34(dd, J= 2.9 and 9.8Hz, 1H), 6.61(d, J=9.9Hz, 1H) and 4.51 (s,2H) ppm.

- 20 Step 3: 4-[1-(5-Chloro-2-oxo-2H-[1,2']bipyridinyl-5'-ylmethyl)-1H-pyrrol-2-ylmethyl]-benzonitrile hydrochloride

- The bromide from Step 2 (0.750g, 2.50 mmol) and the 4-(1-trityl-1H-imidazol-4-ylmethyl)-benzonitrile (1.06g, 2.50 mmol) in CH<sub>3</sub>CN (10 mL) were heated at 60°C. The reaction was cooled to room temperature and the solids collected by filtration and washed with EtOAc (10mL).  
25 The solid was suspended in methanol (50 mL) and heated at reflux for 1 hr, cooled and the solvent evaporated in vacuo. The sticky residue was stirred in EtOAc (40mL) for 4 hrs and the resulting solid hydrobromide salt collected by filtration and washed with EtOAc (40mL) and dried in  
30 vacuo. The hydrobromide salt was partitioned between sat. NaHCO<sub>3</sub> and CH<sub>2</sub>Cl<sub>2</sub> and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic extracts were dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated in vacuo. The residue was chromatographed (silica gel, MeOH: CH<sub>2</sub>Cl<sub>2</sub> 4:96 to 5:95 gradient

elution) to afford the free base which was converted to the hydrochloride salt to afford the title compound as a white solid.

<sup>1</sup>H NMR (400 MHz, CD<sub>3</sub>OD) δ 9.11 (s, 1H), 8.35 (s, 1H), 8.03(d, J=2.9Hz, 1H), 7.83 (d, J=8.4 Hz, 1H), 7.76 (dd, J=2.4 and 9.6Hz, 1H), 7.68-7.58 (m, 3H), 7.48 (s, 1H), 7.31(d, J=8.6Hz, 2H), 6.68 (d, J=9.3Hz, 1H), 5.53 (s, 2H) and 4.24 (s, 2H) ppm.

Analysis: Calc for C<sub>22</sub>H<sub>16</sub>N<sub>5</sub>OCl: 1.75 HCl, 0.15 EtOAc

C 56.69, H 3.99, N 14.62

Found: C 56.72, H 4.05, N 14.54

#### EXAMPLE 4

Preparation of (R)-1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[2-(ethanesulfonyl)methyl]-2-piperazinone dihydrochloride

Step A: Preparation of (R)-2-(tert-butoxycarbonylamino)-N-(3-chlorophenyl)-3-[(triphenylmethyl)thio]-1-propanamine

To a solution of 3-chloroaniline (0.709 mL, 6.70 mmol) in 30 mL of dichloromethane at room temperature was added 1.2 g of crushed 4Å molecular sieves. Sodium triacetoxyborohydride (3.55 g, 16.7 mmol) was added, followed by dropwise addition of *N*-methylmorpholine to achieve a pH of 6.5. *L*-S-Trityl-*N*-Boc-cysteinyl (3.15 g, 7.04 mmol) (prepared according to S.L. Graham et al. *J. Med. Chem.*, (1994) Vol. 37, 725-732) was added, and the solution was stirred for 48 hours. The reaction was quenched with sat. aq. NaHCO<sub>3</sub>, diluted with EtOAc, and the layers were separated. The organic material was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide an oil which was purified by silica gel chromatography (15% EtOAc/hexane) to give the title amine.

Step B: Preparation of (R)-N-[2-(*tert*-butoxycarbonylamino)-3-  
((triphenylmethyl)thio)propyl]-2-chloro-N-(3-  
chlorophenyl)acetamide

5 The aniline derivative from Step A (2.77 g, 4.95 mmol) was dissolved in 73 mL of EtOAc and 73 mL of sat. NaHCO<sub>3</sub> soln., then cooled to 0°C. With vigorous stirring, chloroacetyl chloride (0.533 mL, 6.69 mmol) was added dropwise. After 3 hours, the reaction was diluted with water and EtOAc, and the organic layer was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide crude titled  
10 chloroacetamide which was used without further purification.

Step C: Preparation of (R)-4-(*tert*-butoxycarbonyl)-1-(3-  
chlorophenyl)-5-[S-(triphenylmethyl)thiomethyl]piperazin-  
2-one

15 To a solution of chloroacetamide from Step B (3.29 g crude, theoretically 4.95 mmol) in 53 mL of DMF at 0°C was added cesium carbonate (4.84 g, 14.85 mmol). The solution was stirred for 48 hours, allowing it to warm to room temperature. The solution was poured into EtOAc, washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and  
20 concentrated *in vacuo* to provide the crude product as an oil. This material was purified by silica gel chromatography (20% EtOAc/hexane) to yield the product as a white solid.

Step D: Preparation of (R)-4-(*tert*-butoxycarbonyl)-1-(3-  
25 chlorophenyl)-5-(thiomethyl)piperazin-2-one

A solution of piperazinone from Step C (625 mg, 1.04 mmol) in degassed EtOAc (38 mL) and EtOH (12 mL) was warmed to 30°C. A solution of AgNO<sub>3</sub> (177 mg, 1.04 mmol) and pyridine (0.084 mL, 1.04 mmol) in 8 mL of EtOH was added, and the solution was heated to  
30 reflux. After 45 minutes, the reaction was concentrated *in vacuo*, then redissolved in 26 mL of degassed EtOAc. Through this solution was bubbled H<sub>2</sub>S gas for 2.5 minutes, then activated charcoal was added after 4 minutes. The material was filtered through celite and rinsed with degassed EtOAc, concentrated *in vacuo*, then reconcentrated from

degassed CH<sub>2</sub>Cl<sub>2</sub> to provide the crude product which was used without further purification.

5     Step E:       Preparation of (R)-4-(*tert*-butoxycarbonyl)-1-(3-chlorophenyl)-5-[(ethylthio)methyl]piperazin-2-one

          A solution of the thiol from Step D (*ca.* 1.04 mmol) in 3 mL of THF was added *via* cannula to a suspension of NaH (51.4 mg, 60% disp. in mineral oil, 1.28 mmol) in 2 mL THF at 0°C. After 10 minutes, iodoethane was added (0.079 mL, 0.988 mmol), and the solution was  
10     stirred for 1.5 hours. The reaction was poured into EtOAc, washed with sat. NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide the crude product. This material was purified by silica gel chromatography (1% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to yield the titled product.

15     Step F:       Preparation of (R)-4-(*tert*-butoxycarbonyl)-1-(3-chlorophenyl)-5-[(ethanesulfonyl)methyl]piperazin-2-one

          To a solution of the sulfide from Step E (217 mg, 0.563 mmol) in 3 mL of MeOH at 0°C was added a solution of magnesium monoperoxyphthalate (835 mg, 1.69 mmol) in 2 mL MeOH. The reaction  
20     was stirred overnight, allowing it to warm to room temperature. The solution was cooled to 0 °C, quenched by the addition of 4 mL 2N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln., then concentrated *in vacuo*. The residue was partitioned between EtOAc and sat NaHCO<sub>3</sub> solution, and the organic layer was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo* to provide  
25     the crude sulfone as a white waxy solid.

Step G:       Preparation of (R)-1-(3-chlorophenyl)-4-[1-(4-cyanobenzyl)-5-imidazolylmethyl]-5-[2-(ethanesulfonyl)methyl]-2-piperazinone dihydrochloride

30     To a solution of the Boc-protected piperazinone from Step F (224 mg, 0.538 mmol) in 5 mL of dichloromethane at 0°C was added 2.5 mL of trifluoroacetic acid (TFA). After 45 minutes, the reaction was concentrated *in vacuo*, then azeotroped with benzene to remove the excess TFA. The residue was taken up in 4 mL of 1,2-dichloroethane

and cooled to 0°C. To this solution was added 4Å powdered molecular sieves (340 mg), followed by sodium triacetoxyborohydride (285 mg, 1.34 mmol) and several drops of triethylamine to achieve pH = 6. The imidazole carboxaldehyde from Step E of Example 42 (125 mg, 0.592 mmol) was added, and the reaction was stirred at 0°C. After 2 days, the reaction was poured into EtOAc, washed with dilute aq. NaHCO<sub>3</sub>, and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The crude product was taken up in methanol and injected onto a preparative HPLC column and purified with a mixed gradient of 15%-50% acetonitrile/0.1% TFA; 85%-50% 0.1% aqueous TFA over 60 minutes. After concentration *in vacuo*, the resultant product was partitioned between dichloromethane and aq. NaHCO<sub>3</sub> soln., and the aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic solution was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to dryness to provide the product free base, which was taken up in CH<sub>2</sub>Cl<sub>2</sub> and treated with 2.1 equivalents of 1 M HCl/ether solution. After concentrated *in vacuo*, the product dihydrochloride was isolated as a white powder.

#### EXAMPLE 5

Preparation of (±)-19,20-Dihydro-19-oxo-5*H*-18,21-ethano-12,14-etheno-6,10-metheno-22*H*-benzo[*d*]imidazo[4,3-*k*][1,6,9,12]oxatriaza-cyclooctadecine-9-carbonitrile, dihydrochloride

Step A: Preparation of N-(7-hydroxy-1-naphthyl)-2-[(2-(hydroxy)ethyl)amino]acetamide

To a solution of 8-amino-2-naphthol (15.00 g, 94.2 mmol) in 300 mL of isopropyl acetate and 250 mL of saturated NaHCO<sub>3</sub> solution at

0°C was added chloroacetyl chloride (18.75 mL, 235 mmol). 30 minutes, the layers were separated, and the organic layer was filtered through a glass frit to remove insolubles. Ethanolamine was added (20.9 mL, 377 mmol), and the reaction was warmed to 50°C for 2 hours, then cooled to room temperature. The solution was poured into EtOAc, washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The titled product was obtained as a dark brown solid which was used in the next reaction without further purification.

10 Step B: Preparation of N-(7-hydroxy-1-naphthyl)-2-[(2-(hydroxy)ethyl)*tert*-butoxycarbonyl aminolacetamide]  
To a solution of the product from Step A (7.50 g, 28.8 mmol) in 100 mL of tetrahydrofuran at 0°C was added di-*tert*-butyldicarbonate (6.29 g, 28.8 mmol). After 1.5 hours, the solution was concentrated *in vacuo* to provide the titled product as a dark brown foam which was used in the next reaction without further purification.

Step C: Preparation of 4-*tert*-butoxycarbonyl-1-(7-hydroxy-1-naphthyl)-2-piperazinone  
20 To a solution of di-*tert*-butylazodicarboxylate (10.81 g, 43.2 mmol) in 60 mL of tetrahydrofuran at 0°C was added tributylphosphine (10.76 mL, 43.2 mmol) dropwise. After 10 minutes, a solution of the crude product from Step B (ca. 28.8 mmol) in 30 mL of tetrahydrofuran was added dropwise, and the reaction was allowed to warm to room temperature. After two hours, HPLC analysis showed partial conversion. The solution was cooled to 0°C, and additional portions of tributylphosphine (3.0 mL, 18 mmol) and di-*tert*-butylazodicarboxylate (4.6 g, 18 mmol) were added. The reaction was warmed to room temperature, and stirred for 16 hours. The solution was concentrated *in vacuo*, and the resulting product was purified by silica gel chromatography (0-5% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide the titled product as a dark brown foam, contaminated with tributylphosphine oxide impurity. This material was used in the next reaction without further purification.

35

Step D: Preparation of 1-(7-benzyloxy-1-naphthyl)-4-*tert*-  
butoxycarbonyl-2-piperazinone

To a solution of the product from Step C (ca. 28.8 mmol) in 150 mL of acetone was added potassium carbonate (20.0 g, 145 mmol),  
5 followed by benzyl bromide (3.45 mL, 29 mmol). The reaction was heated to reflux, and stirred for 18 hours. After cooling to room temperature, the solution was concentrated *in vacuo* to a 50 mL volume, poured into EtOAc, washed with sat. aq. NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>),  
10 filtered, and concentrated *in vacuo*. The crude product mixture was purified by silica gel chromatography (40-50% EtOAc/hexane) to provide the titled compound as a pale brown foam.

Step E: Preparation of 1-(7-benzyloxy-1-naphthyl)-2-piperazinone  
hydrochloride

15 Through a solution of the product from Step D (1.244 g, 2.88 mmol) in 50 mL of ethyl acetate at 0°C was bubbled anhydrous HCl gas for 5 minutes. After 30 minutes, the solution was concentrated *in vacuo* to provide the titled salt as a brown powder (1.064 g) which was used in the next reaction without further purification.

20

Step F: Preparation of 1-(7-benzyloxy-1-naphthyl)-4-[1-(4-cyano-  
3-fluorobenzyl)-5-imidazolylmethyl]-2-piperazinone

To a solution of the crude amine hydrochloride from Step E (2.88 mmol) in 15 mL of 1,2-dichloroethane was added 4Å powdered  
25 molecular sieves (2.0 g), followed by sodium triacetoxyborohydride (911 mg, 4.32 mmol). The aldehyde from Step G of Example 1 was added (659 mg, 2.88 mmol), and the reaction was stirred for 40 minutes. The reaction was poured into EtOAc, washed with sat. aq. NaHCO<sub>3</sub> and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The titled  
30 product was obtained as a brown foam which was used in the next reaction without further purification.

Step G: Preparation of 1-(7-hydroxy-1-naphthyl)-4-[1-(4-cyano-3-fluorobenzyl)-5-imidazolymethyl]-2-piperazinone  
trifluoroacetate

To a solution of the benzyl ether from Step F (1.563 g, 2.85 mmol) in 25 mL of 1:1 MeOH/EtOAc was added trifluoroacetic acid (1.0 mL) and 10% palladium on carbon (900 mg). The solution was stirred under a balloon atmosphere of hydrogen at room temperature. After 8 hours, the solution was filtered through celite, and the filter pad was rinsed with 1:1 MeOH/THF. Concentration *in vacuo* provided the titled product as a white foam which was used in the next reaction without further purification.

Step H: Preparation of ( $\pm$ )-19,20-Dihydro-19-oxo-5*H*-18,21-ethano-12,14-etheno-6,10-metheno-22*H*-benzo[*d*]imidazo[4,3-*k*][1,6,9,12]oxatriaza-cyclooctadecine-9-carbonitrile,  
dihydrochloride

To a solution of the product from Step G (ca. 2.85 mmol) in 50 mL of DMSO was added cesium carbonate (2.815 g, 8.64 mmol). The reaction was warmed to 55 °C under argon for 45 minutes, then cooled to room temperature. The solution was poured into EtOAc and washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated *in vacuo*. The resulting product was purified by silica gel chromatography (5-8% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide the product as a pale yellow foam. A portion of this was taken up in CH<sub>2</sub>Cl<sub>2</sub>, treated with excess 1 M HCl/ether solution, and concentrated *in vacuo* to provide the titled product dihydrochloride as a pale yellow powder.

FAB mass spectrum *m/e* 436.3 (M+1).

(+)-19,20-Dihydro-19-oxo-5*H*-18,21-ethano-12,14-etheno-6,10-metheno-22*H*-benzo[*d*]imidazo[4,3-*k*][1,6,9,12]oxatriazacyclooctadecine-9-carbonitrile, Enantiomer A dihydrochloride

---

5

A sample of free base of the compound described in Example 5, Step H (96 mg in 3 mL of MeOH) was resolved by preparative chiral HPLC at 310 nm using a Chiralcel OD 250 x 4.6 mm column, and eluting with a 80% ethanol/0.1% diethylamine-hexane at a flow rate of 1.0 mL/min. The faster eluting product was taken up in CH<sub>2</sub>Cl<sub>2</sub>, treated with excess 1 M HCl/ether solution, and concentrated *in vacuo* to provide the titled product dihydrochloride as a pale white powder. Assay for enantiomeric purity (retention time = 8.04 min; Chiralcel OD 25 x 2 mm; 80-100% gradient: ethanol/0.1% diethylamine-hexane over 45 min; flow rate 8.0 mL/min; 310 nm) indicated 96.4% enantiomeric excess. EXAMPLE 8

1-(3-chlorophenyl)-4-[1-(4-cyano-3-methoxybenzyl)-5-imidazolylmethyl]-2-piperazinone dihydrochloride

5    Step A:      Preparation of Methyl 4-Amino-3-hydroxybenzoate

Through a solution of 4-amino-3-hydroxybenzoic acid (75 g, 0.49 mol) in 2.0 L of dry methanol at room temperature was bubbled anhydrous HCl gas until the solution was saturated. The solution was stirred for 48 hours, then concentrated in vacuo. The product  
10 was partitioned between EtOAc and saturated aq. NaHCO<sub>3</sub> solution, and the organic layer was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated in vacuo to provide the titled compound.

15    Step B:      Preparation of Methyl 3-Hydroxy-4-iodobenzoate

A cloudy, dark solution of the product from Step A (79 g, 0.47 mol), 3N HCl (750 mL), and THF (250 mL) was cooled to 0°C. A solution of NaNO<sub>2</sub> (35.9 g, 0.52 mol) in 115 mL of water was added over ca. 5 minutes, and the solution was stirred for another 25 minutes. A solution of potassium iodide (312 g, 1.88 mol) in 235 mL of  
20 water was added all at once, and the reaction was stirred for an additional 15 minutes. The mixture was poured into EtOAc, shaken, and the layers were separated. The organic phase was washed with water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated in vacuo to provide the crude product (148 g). Purification by column  
25 chromatography through silica gel (0%-50% EtOAc/hexane) provided the titled product.

30    Step C:      Preparation of Methyl 4-Cyano-3-hydroxybenzoate

A mixture of the iodide product from Step B (101 g, 0.36 mol) and zinc(II)cyanide (30 g, 0.25 mol) in 400 mL of dry DMF was degassed by bubbling argon through the solution for 20 minutes. Tetrakis(triphenylphosphine)palladium (8.5 g, 7.2 mmol) was added, and the solution was heated to 80°C for 4 hours. The solution was cooled to room temperature, then stirred for an additional 36 hours.  
35 The reaction was poured into EtOAc/water, and the organic layer

was washed with brine (4x), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated in vacuo to provide the crude product. Purification by column chromatography through silica gel (30%-50% EtOAc/hexane) provided the titled product.

5

Step D: Preparation of Methyl 4-Cyano-3-methoxybenzoate

Sodium hydride (9 g, 0.24 mol as 60% wt. disp. mineral oil) was added to a solution of the phenol from Step C (36.1 g, 204 mmol) in 400 mL of dry DMF at room temperature. Iodomethane was added (14 mL, 0.22 mol) was added, and the reaction was stirred for 2 hours. The mixture was poured into EtOAc/water, and the organic layer was washed with water and brine (4x), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated in vacuo to provide the titled.

15 Step E: Preparation of 4-Cyano-3-methoxybenzyl Alcohol

To a solution of the ester from Step D (48.8 g, 255 mmol) in 400 mL of dry THF under argon at room temperature was added lithium borohydride (255 mL, 510 mmol, 2M THF) over 5 minutes. After 1.5 hours, the reaction was warmed to reflux for 0.5 hours, then cooled to room temperature. The solution was poured into EtOAc/1N HCl soln. [CAUTION], and the layers were separated. The organic layer was washed with water, sat  $\text{Na}_2\text{CO}_3$  soln. and brine (4x), dried ( $\text{Na}_2\text{SO}_4$ ), and concentrated in vacuo to provide the titled product.

25 Step F: Preparation of 4-Cyano-3-methoxybenzyl Bromide

A solution of the alcohol from Step E (35.5 g, 218 mmol) in 500 mL of dry THF was cooled to  $0^\circ\text{C}$ . Triphenylphosphine was added (85.7 g, 327 mmol), followed by carbontetrabromide (108.5 g, 327 mmol). The reaction was stirred at  $0^\circ\text{C}$  for 30 minutes, then at room temperature for 21 hours. Silica gel was added (ca. 300 g), and the suspension was concentrated in vacuo. The resulting solid was loaded onto a silica gel chromatography column. Purification by flash chromatography (30%-50% EtOAc/hexane) provided the titled.

Step G: Preparation of 1-(4-cyano-3-methoxybenzyl)-5-(acetoxymethyl)-imidazole hydrobromide

---

5 The titled product was prepared by reacting the bromide from Step F (21.7 g, 96 mmol) with the imidazole product from Step B of Example 8 (34.9 g, 91 mmol) using the procedure outlined in Step C of Example 8. The crude product was triturated with hexane to provide the titled product hydrobromide.

10 Step H: Preparation of 1-(4-cyano-3-methoxybenzyl)-5-(hydroxymethyl)-imidazole

---

15 The titled product was prepared by hydrolysis of the acetate from Step G (19.43 g, 68.1 mmol) using the procedure outlined in Step D of Example 1. The crude titled product was isolated both directly from extraction or through concentration of the aqueous extracts which provided solid material (ca. 100 g) which contained a significant quantity of the titled product, as judged by  $^1\text{H}$  NMR spectroscopy.

20 Step I: Preparation of 1-(4-cyano-3-methoxybenzyl)-5-imidazolecarboxaldehyde

---

25 The titled product was prepared by oxidizing the alcohol from Step H (11 g, 45 mmol) using the procedure outlined in Step E of Example 1. The titled aldehyde was isolated as a white powder which was sufficiently pure for use in the next step without further purification.

30 Step J: Preparation of 1-(3-chlorophenyl)-4-[1-(4-cyano-3-methoxybenzyl)-5-imidazolylmethyl]-2-piperazinone dihydrochloride

---

The titled product was prepared by reductive alkylation of the aldehyde from Step I (859 mg, 3.56 mmol) and the amine (hydrochloride) from Step E of Example 2 (800 mg, 3.24 mmol) using the procedure outlined in Step F of Example 2. Purification by flash column chromatography through silica gel (50%-75% acetone

CH<sub>2</sub>Cl<sub>2</sub>) and conversion of the resulting white foam to its dihydrochloride salt provided the titled product as a white powder.

FAB ms (m+1) 437.

#### EXAMPLE 9

10 1-(3-trifluoromethoxyphenyl)-4-[1-(4-cyano-3-methoxybenzyl)-5-imidazolyl methyl]-2-piperazinone dihydrochloride

1-(3-trifluoromethoxy-phenyl)-2-piperazinone hydrochloride was prepared from 3-trifluoromethoxyaniline using Steps A-E of Example 2. This amine (1.75 g, 5.93 mmol) was coupled to the aldehyde from Step I of Example 8 (1.57 g, 6.52 mmol) using the procedure outlined in Step F of Example 2. Purification by flash column chromatography through silica gel (60%-100% acetone CH<sub>2</sub>Cl<sub>2</sub>) and conversion of the resulting white foam to its dihydrochloride salt provided the titled product as a white powder.

20 FAB ms (m+1) 486.

#### 25 EXAMPLE 10

4-{3-[4-(-2-Oxo-2-H-pyridin-1-yl)benzyl]-3-H-imidazol-4-ylmethyl}benzonitrile

Step 1: 4-Iodobenzyl alcohol

30 Methyl 4-iodobenzoate (5g, 19.07 mmol) was suspended in THF (100 mL). LiBH<sub>4</sub> (40 mmol) was added slowly, via syringe. Reaction mixture was heated to 60° for 4 days. 1N HCl was added slowly. Reaction mixture was stirred for 1/2 hour then was extracted 3 times with EtOAc. The organic layers were combined, washed with saturated NaHCO<sub>3</sub>,

brine, dried ( $\text{MgSO}_4$ ), filtered and concentrated to give 4-iodobenzyl alcohol as a white solid.

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.68 (d, 2H); 7.11 (d, 2H); 4.71 (d, 2H); 1.65 (t, 1H)

5

Step 2: 4-(-2-Oxo-2-H-pyridin-1-yl)benzyl alcohol

2-Hydroxypyridine (10.0 mmol; 956 mg), 4-iodobenzyl alcohol (17.09 mmol, 4.0g),  $\text{K}_2\text{CO}_3$  (11.0 mmol, 1.52 g), and copper (0.2 mmol, 15 mg) were mixed under argon and heated to  $150^\circ$  for 16 hours. The solid was partitioned between saturated  $\text{NaHCO}_3$  and EtOAc. The layers were separated and the aqueous layer was back extracted twice with EtOAc. The organic layers were combined, washed with brine, dried over  $\text{MgSO}_4$ , filtered and concentrated to yield a yellow oil which was purified by flash chromatography (EtOAc) to give pure the title compound as a crystalline solid.

10

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.50 (d, 2H); 7.43-7.41 (m, 4H); 6.68-6.65 (d, 1H); 6.27-6.23 (t, 1H); 4.75-4.75 (d, 2H); 1.96-1.95 (bt, 1H).

15

Step 3: 4-(-2-Oxo-2-H-pyridin-1-yl)benzyl bromide

A solution of NBS (1.59g, 8.94 mmol) and  $\text{CH}_2\text{Cl}_2$  was cooled to  $0^\circ$ . To this solution (under Ar) was added  $\text{Me}_2\text{S}$  (10.72 mmol, 0.78 mL) via syringe. This mixture was then cooled to  $-20^\circ$  and added to a solution of the benzyl alcohol from Step 2 (1.2g, 5.96 mmol) in  $\text{CH}_2\text{Cl}_2$  via pipette. The reaction mixture was warmed to  $0^\circ$  and stirred for several hours. The residue was poured into ice water and extracted with  $\text{CH}_2\text{Cl}_2$  (3x). The organic layers were combined, washed with brine, dried ( $\text{MgSO}_4$ ), filtered and concentrated to give the title compound as a yellow solid, which will be used in the next step without further purification.

20

25

$^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.53-7.51 (d, 2H); 7.37-7.31 (m, 4H); 6.67 (d, 1H); 6.25 (t, 1H); 4.52 (s, 2H).

30

Step 4: 4-(1-Trityl-1H-imidazol-4-ylmethyl)-benzonitrile

To a suspension of activated zinc dust (3.57g, 54.98 mmol) in THF (50 mL) was added dibromoethane (0.315 mL, 3.60 mmol) and the reaction stirred under argon for 45 minutes, at  $20^\circ\text{C}$ . The suspension

35

was cooled to 0°C and  $\alpha$ -bromo-p-tolunitrile (9.33g, 47.6 mmol) in THF (100 mL) was added dropwise over a period of 10 minutes. The reaction was then allowed to stir at 20°C for 6 hours and bis(triphenylphosphine)Nickel II chloride (2.40g, 3.64 mmol) and 5-iodotrityl  
5 imidazole (15.95g, 36.6 mmol) were added in one portion. The resulting mixture was stirred 16 hours at 20°C and then quenched by addition of saturated  $\text{NH}_4\text{Cl}$  solution (100 mL) and the mixture stirred for 2 hours. Saturated aq.  $\text{NaHCO}_3$  solution was added to give a pH of 8 and the solution was extracted with EtOAc (2 x 250 mL), dried ( $\text{MgSO}_4$ ) and the  
10 solvent evaporated in vacuo. The residue was chromatographed (silica gel, 0-20% EtOAc in  $\text{CH}_2\text{Cl}_2$ ) to afford the title compound as a white solid.  
 $^1\text{H}$  NMR ( $\text{CDCl}_3$ , 400Mz)  $\delta$  (7.54 (2H, d,  $J=7.9\text{Hz}$ ), 7.38(1H, s), 7.36-7.29 (11H, m), 7.15-7.09(6H, m), 6.58(1H, s) and 3.93(2H, s) ppm.

15

Step 5:      4-{3-[4-(2-Oxo-2-H-pyridin-1-yl)benzyl]-3-H-imidazol-4-ylmethyl}benzonitrile

4-(2-Oxo-2-H-pyridin-1-yl)benzyl bromide from Step 3 (1.7 mmol, 450 mg) and 4-(1-trityl-1H-imidazol-4-ylmethyl)-benzonitrile (1.7  
20 mmol) were suspended in  $\text{CH}_3\text{CN}$  and heated to reflux for 3 hours. The reaction mixture was concentrated and the residue taken up in MeOH and refluxed for 2 hours. The MeOH was removed in-vacuo. The resulting oil was partitioned between EtOAc and saturated  $\text{NaHCO}_3$ . The aqueous layer was extracted twice with EtOAc. The organic layers  
25 were combined, washed with brine, dried ( $\text{MgSO}_4$ ), filtered and concentrated to yield an oil which was purified by flash chromatography using 5% IPA/ $\text{CHCl}_3$  saturated with  $\text{NH}_3$  as an eluent. Pure fractions were collected and concentrated to give a white solid. The solids were washed with warm 50% EtOAc/Hexane and collected on a frit. The  
30 white solid was collected and dried under high vacuum at 50° for 12 hours to give the title compound.  
 $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ )  $\delta$  7.58-7.55 (m, 3H); 7.42-7.40 (m, 1H); 7.39 (d, 2H); 7.27 (s, 1H); 7.20 (d, 2H); 7.04 (d, 2H); 6.67 (d, 1H); 6.27 (t, 1H); 4.97 (s, 2H); 3.89 (s, 2H).

### EXAMPLE 11

4-{1-[4-(5-Chloro-2-oxo-2H-pyridin-1-yl)-benzyl]-1H-imidazol-2-ylmethyl}-benzonitrile

5

Step 1: 5-Chloro-1-(4-hydroxymethyl-phenyl)-1H-pyridin-2-one

5-Chloro-2-pyridinol (0.61g, 4.7 mmol), 4-iodobenzyl-alcohol (1.00g, 4.27 mmol), Copper (0.27g, 4.27 mmol) and K<sub>2</sub>CO<sub>3</sub> (0.65g, 4.70 mmol) were heated at 180°C for 16 hrs. The brown reaction mixture was cooled, diluted with EtOAc and washed with saturated NaHCO<sub>3</sub>. The aqueous layer was extracted with EtOAc (2x) and the combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated in vacuo. The residue was chromatographed (silica gel, EtOAc as eluent) to afford the title compound as a white solid.

<sup>1</sup>H NMR (400 MHz, CD<sub>3</sub>OD) δ 7.74 (d, J= 2.7Hz, 1H), 7.59 (dd, J=3.0 and 9.6Hz, 1H), 7.51 (d, J=8.6Hz, 2H), 7.37 (d, J=8.4Hz, 2H), 6.61 (d, J=9.4Hz, 1H) and 4.67(s,1H) ppm.

Step 2: 1-(4-Bromomethyl-phenyl)-5-chloro-1H-pyridin-2-one

To N-bromosuccinimide (0.166g, 0.929 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (3 mL) at 0°C was added dimethylsulfide (0.082 mL, 1.11 mmol). The resulting suspension was cooled to -20°C and a solution of the alcohol from Step 1 (0.146g, 0.62 mmol) in CH<sub>2</sub>Cl<sub>2</sub> was added dropwise over 2 minutes. The reaction mixture was stirred at 0°C for 6 hrs and then poured into water and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The extracts were dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated in vacuo. The residue was chromatographed (silica gel, EtOAc: CH<sub>2</sub>Cl<sub>2</sub> 1:1 as eluent) to afford the title compound as a white solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.54 (d, J= 8.4Hz, 2H), 7.40-7.32 (m, 4H), 6.63 (dd, J=9.7 and 0.7Hz, 1H) and 4.51(s,2H) ppm.

Step 3: 4-{1-[4-(5-Chloro-2-oxo-2H-pyridin-1-yl)-benzyl]-1H-imidazol-2-ylmethyl}-benzonitrile

The bromide from Step 2 (0.154g, 0.516 mmol) and 4-(1-trityl-1H-imidazol-4-ylmethyl)-benzonitrile (0.22g, 0.516 mmol) prepared as

described in Example 10, Step 4, in  $\text{CH}_3\text{CN}$  (2mL) were heated at  $55^\circ\text{C}$ . After 18 hr methanol (3 mL) was added and the reaction was heated at reflux for 3 hrs, cooled and the solvent evaporated in vacuo. The residue was partitioned between sat.  $\text{NaHCO}_3$  and  $\text{CH}_2\text{Cl}_2$  and extracted with

5  $\text{CH}_2\text{Cl}_2$ . The organic extracts were dried ( $\text{Na}_2\text{SO}_4$ ) and evaporated in vacuo. The residue was chromatographed (silica gel,  $\text{MeOH}:\text{CH}_2\text{Cl}_2$  5:95 as eluent) to afford the free base which was converted to the hydrochloride salt to afford the title compound as a white solid.

10  $^1\text{H}$  NMR (400 MHz,  $\text{CD}_3\text{OD}$ )  $\delta$  9.03 (s, 1H), 7.80-7.55 (m, 4H), 7.55-7.20 (m, 7H) 6.64 (d,  $J=9.7\text{Hz}$ , 1H), 5.45 (s, 2H) and 4.18 (s, 2H) ppm.

Analysis: % Calc for  $\text{C}_{22}\text{H}_{17}\text{N}_5\text{O}\cdot 1.00\text{HCl}\cdot 0.55\text{H}_2\text{O}\cdot 0.25\text{CH}_3\text{CN}$

15 EXAMPLE 12

4-[3-(2-Oxo-1-phenyl-1,2-dihydropyridin-4-ylmethyl)-3H-imidazol-4-ylmethyl]benzonitrile

---

Step 1: 4-Hydroxymethyl-1H-pyridin-2-one

20 2-Oxo-1,2-dihydropyridine-4-carboxylic acid methyl ester (1.8g, 12.2 mmol), prepared as described in *J. Org. Chem.*, 26, 428 (1961), was suspended in THF(100ml). A small amount of DMF was added to help increase solubility.  $\text{LiBH}_4$  (61 mmol) was added and the reaction was stirred for 18 hours at room temperature. MeOH and  $\text{H}_2\text{O}$  are

25 added to quench the reaction. The reaction is then concentrated to yield a yellow oil. Flash chromatography (5%  $\text{MeOH}/\text{CHCl}_3$  to 20%  $\text{MeOH}/\text{CHCl}_3$ ) yielded 4-hydroxymethyl-1H-pyridin-2-one as a white solid.

30  $^1\text{H}$  NMR (400 MHz,  $\text{CD}_3\text{OD}$ )  $\delta$  7.38-7.36 (1H,d); 6.56 (s, 1H); 6.37-6.36 (d, 1H); 4.50 s, 2H).

Step 2: 4-(tert-butyldimethylsilyloxymethyl)-1H-pyridin-2-one

4-Hydroxymethyl-1H-pyridin-2-one from Step 1 (1.3g, 10.5 mmol) was dissolved in DMF. t-Butyl dimethylsilyl chloride (12.6 mmol, 1.9g) and imidazole (12.6 mmol, 858 mg) were added and the reaction

35

was stirred for 16 hours. The reaction mixture was diluted with EtOAc and washed with H<sub>2</sub>O (2x) and brine. The organic layer was dried

(MgSO<sub>4</sub>), filtered and concentrated to yield a yellow oil. Flash

chromatography (EtOAc) yielded 4-(tert-butyl-dimethylsilyloxy-methyl)-

5 1H-pyridin-2-one as an off white solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.30-7.28 (d, 1H); 6.60 (s, 1H); 6.20-6.18 (d, 1H); 4.58 (s, 2H); 0.955 (s, 9H); 0.11 (s, 6H).

Step 3: 4-(tert-butyl-dimethyl-silyloxy-methyl)-1-phenyl-1H-  
10 pyridin-2-one

4-(Tert-butyl-dimethylsilyloxy-methyl)-1H-pyridin-2-one from

Step 2 (1.5g, 6.3 mmol) was dissolved in iodobenzene (189 mmol, 21.12 mL) and treated with copper (6.3 mmol, 400 mg) and K<sub>2</sub>CO<sub>3</sub> (6.93 mmol,

958 mg.). The brown slurry was heated to 180° for 16 hrs. The reaction

15 mixture was cooled, diluted with CHCl<sub>3</sub> and washed with saturated NaHCO<sub>3</sub>. The aqueous layer was back extracted with CHCl<sub>3</sub> (2x). The

organic layers were combined, washed with brine, dried (MgSO<sub>4</sub>),

filtered and concentrated to yield a yellow oil. Flash Chromatography

(20% EtOAc/Hexane) yielded 4-(tert-butyl-dimethyl-silyloxy-methyl)-1-

20 phenyl-1H-pyridin-2-one as a white solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.49-7.47 (m, 2H); 7.43-7.39 (m, 3H); 7.29-7.28 (d, 2H); 6.65 (s, 1H); 6.19 (d, 2H); 4.59 (s, 2H); 0.97 (s, 9H); 0.14 (s, 6H).

Step 4: 4-Hydroxymethyl-1-phenyl-1H-pyridin-2-one

25 4-(Tert-butyl-dimethyl-silyloxy-methyl)-1-phenyl-1H-pyridin-

2-one from Step 3 (1.3g) was dissolved in TBAF in 1M THF (15 mL). The

clear reaction mixture was stirred for 16 hours. The reaction mixture

was concentrated and purified on a column of silica eluting with 10%

MeOH/EtOAc to yield 4-hydroxymethyl-1-phenyl-1H-pyridin-2-one as a

30 tan solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.5-7.47 (m, 2H); 7.43 (d, 1H); 7.38-7.36 (m, 2H); 7.32-7.30 (d, 1H) 6.67 (s, 1H); 6.23 (d, 1H) 4.57 (d, 2H).

Step 5: 4-Bromomethyl-1-phenyl-1H-pyridin-2-one

4-Hydroxymethyl-1-phenyl-1H-pyridin-2-one from Step 4 (1.0g, 5 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub>. CBr<sub>4</sub> (6 mmol, 2g) was added and the reaction mixture was cooled to 0°. PPh<sub>3</sub> (6 mmol, 2.0 g) was added dropwise in CH<sub>2</sub>Cl<sub>2</sub>. The reaction mixture was stirred at 0° for 15 minutes and then warmed to room temperature. The reaction mixture was concentrated and purified on a column of silica eluting with (30 % EtOAc /hexane to 50% EtOAc/hexane) to give 4-bromomethyl-1-phenyl-1H-pyridin-2-one (8, x=H) as a white solid.

<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.52-7.48 (m, 2H); 7.45-7.43 (d, 1H); 7.38-7.33 (m, 3H); 6.64 (s, 1H); 6.30-6.28 (d, 1H); 4.25 (d, 2H).

Step 6: 4-(1-Trityl-1H-imidazol-4-ylmethyl)-benzonitrile

To a suspension of activated zinc dust (3.57g, 54.98 mmol) in THF (50 mL) was added dibromoethane (0.315 mL, 3.60 mmol) and the reaction stirred under argon for 45 minutes, at 20°C. The suspension was cooled to 0°C and α-bromo-p-tolunitrile (9.33g, 47.6 mmol) in THF (100 mL) was added dropwise over a period of 10 minutes. The reaction was then allowed to stir at 20°C for 6 hours and bis(triphenylphosphine)Nickel II chloride (2.40g, 3.64 mmol) and 5-iodotriyl imidazole (15.95g, 36.6 mmol) were added in one portion. The resulting mixture was stirred 16 hours at 20°C and then quenched by addition of saturated NH<sub>4</sub>Cl solution (100 mL) and the mixture stirred for 2 hours. Saturated aq. NaHCO<sub>3</sub> solution was added to give a pH of 8 and the solution was extracted with EtOAc (2 x 250 mL), dried (MgSO<sub>4</sub>) and the solvent evaporated in vacuo. The residue was chromatographed (silica gel, 0-20% EtOAc in CH<sub>2</sub>Cl<sub>2</sub>) to afford the title compound as a white solid.

<sup>1</sup>H NMR (CDCl<sub>3</sub>, 400Mz) δ (7.54 (2H, d, J=7.9Hz), 7.38(1H, s), 7.36-7.29 (11H, m), 7.15-7.09(6H, m), 6.58(1H, s) and 3.93(2H, s) ppm.

Step 7: 4-[3-(2-Oxo-1-phenyl-1,2-dihydropyridin-4-ylmethyl)-3H-imidazol-4-ylmethyl]benzonitrile, hydrochloride

4-Bromomethyl-1-phenyl-1H-pyridin-2-one from Step 5 (1.1g, 4.1 mmol) and 4-(1-trityl-1H-imidazol-4-ylmethyl)-benzonitrile from Step

- 6 (4.1 mmol, 1.7g) were suspended in CH<sub>3</sub>CN and heated to 80°. After 30 minutes the reaction became homogeneous. The reaction mixture was heated to 80° for 16 hours. The heterogeneous reaction mixture was concentrated, taken up in MeOH and refluxed for 1 hour. The reaction mixture was cooled, diluted with CHCl<sub>3</sub> and washed with saturated NaHCO<sub>3</sub>. The aqueous layer was back extracted 4 times with CHCl<sub>3</sub>. The organic layers were combined, washed with brine, dried (MgSO<sub>4</sub>), filtered and concentrated to yield a yellow solid which was purified by flash chromatography (7% i-PrOH/CHCl<sub>3</sub> saturated with NH<sub>3</sub>). Purest fractions were collected and concentrated to yield a white solid which was triturated with EtOAc. The solids were filtered, washed with EtOAc and dried under hi-vacuum for 16 hours to yield 4-[3-(2-Oxo-1-phenyl-1,2-dihydropyridin-4-ylmethyl)-3H-imidazol-4-ylmethyl]benzonitrile, hydrochloride as a white solid.
- <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 7.61 (s, 1H); 7.58-7.57 (d, 2H) 7.52-7.49 (m, 2H); 7.46-7.44 (d, 1H); 7.34-7.32 (d, 2H); 7.26-7.25 (m, 2H); 6.97 (s, 1H); 6.20 (s, 1H); 5.77 (d, 1H); 4.77 (d, 2H); 3.96 (s, 2H).

### EXAMPLE 13

- Preparation of 4-imidazol-1-ylmethyl-(2-naphthalen-2-yloxy)-benzonitrile hydrochloride

#### Step A: Preparation of 4-bromo-3-fluorobenzoic acid

- 4-Bromo-3-fluorotoluene (40.0 g, 0.212 mol) was heated at 90° C in H<sub>2</sub>O (200 mL) and pyridine (200 mL) with mechanical stirring under Ar. Potassium permanganate (KMnO<sub>4</sub>) (67 g, 0.424 mol) was added portionwise over 3 h. After 4 h, an HPLC of a filtered sample indicated 50 % conversion to the acid. An additional 30 g of KMnO<sub>4</sub> was added and heating continued overnight. HPLC indicated 81% conversion. Further KMnO<sub>4</sub> was added portionwise with reaction monitoring by HPLC until > 95% conversion was obtained. The reaction mixture was filtered through Celite, the filter pad washed with H<sub>2</sub>O, aq NaOH and EtOH. The filtrate was concentrated to a small volume, then partitioned between 3N NaOH solution and diethyl ether. The aqueous basic layer was separated, cooled in an ice- H<sub>2</sub>O bath and acidified

slowly with 6N HCl solution to precipitate the white solid product. This was collected by suction filtration and dried at 40 °C. in a vacuum oven overnight to give the title compound. mp 190 -192°C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.83 (dd, 1H, J = 2, 9 Hz), 7.78 (dd, 1H, J = 2, 8 Hz),

5 7.67 - 7.71 (m, 1H).

Step B: Preparation of 4-bromo-3-fluorobenzyl alcohol

4-Bromo-3-fluorobenzoic acid (40.8 g, 0.187 mol) was dissolved in THF (250 ml) with magnetic stirring under Ar in an ice-H<sub>2</sub>O bath. The cloudy solution was treated dropwise with borane-THF complex (1 M) (374 mL, 0.374 mol) over a 1 h period maintaining the internal temperature at < 10°C. The reaction mixture was left to warm to ambient temperature overnight, then cooled in an ice H<sub>2</sub>O bath and treated dropwise with H<sub>2</sub>O ( 150 mL). The THF was removed on a rotary evaporator, and the residue partitioned between EtOAc and H<sub>2</sub>O. The aqueous layer was extracted with EtOAc (3 x 100 mL), the organic layers combined, washed with brine, and dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give the title compound as an oil which solidified on standing.

20 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.52 (t, 1H, J = 8 Hz), 7.16 (d, 1H, J = 9 Hz), 7.02 (d, 1H, J = 8 Hz), 4.67 (s, 2H), 1.47 ( br s, 1H).

Step C: Preparation of 2-fluoro-4-hydroxymethylbenzonitrile

4-Bromo-3-fluorobenzyl alcohol( 20 g, 0.097 mol) was dissolved in DMF (100 mL) and then placed under high vacuum for 15 min. The solution was then purged with Ar for 15 min. While purging continued, zinc cyanide ( 8 g, 0.068 mol) and the catalyst, Pd[(PPh<sub>3</sub>)<sub>4</sub>], (5.63 g, 0.0049 mol) were added. The reaction mixture was heated at 95°C under Ar for 18 h, then cooled to ambient temperature and added to H<sub>2</sub>O. The mixture was extracted with EtOAc, then washed with 1M HCl, H<sub>2</sub>O, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave the title compound as a white solid after chromatography (silica gel, hexane: EtOAc, 6.5:3.5.

35 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.61 (t, 1H, J = 8 Hz), 7.23 - 7.29 (m, 2H), 4.80 (d, 2H, J = 6 Hz), 1.93 ( t, 1H, J = 6Hz).

Step D: Preparation of 4-bromomethyl-2-fluoro-benzonitrile

N-Bromosuccinimide ( 6.6 g, 0.037 mol) was dissolved in  $\text{CH}_2\text{Cl}_2$  (150 mL), cooled to  $0^\circ\text{C}$  and treated with dimethylsulfide (3.27 mL, 0.0446 mol). The solution was cooled to  $-20^\circ\text{C}$  and then treated dropwise with a solution of 2-fluoro-4-hydroxymethylbenzonitrile (3.74 g, 0.0248 mol) in  $\text{CH}_2\text{Cl}_2$  (30 mL). After the addition, the reaction mixture was stirred at  $0^\circ\text{C}$  for 2 h then left to warm to ambient temperature overnight. The reaction mixture was added to ice/  $\text{H}_2\text{O}$ , extracted with EtOAc, the organic layer separated, washed with brine and dried ( $\text{MgSO}_4$ ). Filtration and concentration to dryness gave the title compound which was purified chromatography (silica gel, 5-10% EtOAc/hexane).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  7.61 (dd, 1H,  $J = 8, 8$  Hz), 7.26 - 7.30 (m, 2H), 4.45 (s, 2H).

Step E: Preparation of 2-fluoro-4-imidazol-1-ylmethyl-benzonitrile

4-Bromomethyl-2-fluoro-benzonitrile (3.44g, 16.0 mmol) and imidazole (5.47 g, 80.3 mmol) were dissolved in DMF (40 mL) and stirred at ambient temperature for 2 h. The DMF was removed *in vacuo* and the residue was partitioned between EtOAc (300 mL) and aqueous saturated  $\text{NaHCO}_3$  solution. The organic layer was separated, washed with  $\text{NaHCO}_3$  solution,  $\text{H}_2\text{O}$ , brine, and dried ( $\text{MgSO}_4$ ). Filtration and concentration to dryness gave the title compound after chromatography (silica gel, 1-2%  $\text{CH}_3\text{OH}/\text{CH}_2\text{Cl}_2$ ).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  7.62 (dd, 1H,  $J = 8.5, 9.5$  Hz), 7.57 (s, 1H), 7.16 (s, 1H), 7.00 (d, 1H,  $J = 8.5$  Hz), 6.94 (d, 1H,  $J = 9.5$  Hz), 6.91 (s, 1H), 5.21 (s, 2H).

Step F: Preparation of 2-(2-naphthyloxy)-4-imidazol-1-ylmethyl-benzonitrile hydrochloride

2-Fluoro-4-imidazol-1-ylmethyl-benzonitrile (0.167 g, 0.830 mmol), 2-naphthol (0.143 g, 0.996 mmol) and cesium carbonate (0.54 g, 1.66 mmol) were dissolved in DMF (15 mL) and heated at  $55^\circ\text{C}$  under Ar for 18 h. The reaction mixture was partitioned between EtOAc and 1N NaOH solution. The organic layer was separated, washed with 1N

NaOH solution, H<sub>2</sub>O, brine, and dried (MgSO<sub>4</sub>). Filtration and concentration to dryness gave the title compound after chromatography (silica gel, 1% CH<sub>3</sub>OH/CH<sub>2</sub>Cl<sub>2</sub>).

### EXAMPLE 15

#### Preparation of 2-(2,4-dichloro-phenylsulfanyl)-4-[5-(2-morpholin-4-yl-ethyl)-imidazol-1-ylmethyl]-benzonitrile

5    Step A:        Preparation of {2-[3-(4-cyano-3-fluoro-benzyl)-3H-imidazol-4-yl]-ethyl}-carbamic acid tert-butyl ester

To a solution of  $N^{\Gamma}$ -pivaloyloxymethyl- $N^{\alpha}$ -phthaloyl-histamine (J. C. Emmett, F. H. Holloway, and J. L. Turner, *J. Chem. Soc., Perkin Trans. 1*, 1341, (1979)) (4.59 g, 0.0124 mol) in acetonitrile (40 mL) was added 2-fluoro-4-imidazol-1-ylmethyl-benzonitrile (as described in Example 13, Step D) (2.8 g, 0.013 mol) and the mixture was heated to reflux for 18 hr. A white solid precipitate formed which after cooling to 0°C was collected by filtration to obtain the quaternary salt. This intermediate was dissolved in EtOH (100 mL), hydrazine (1.46 mL, 0.046 mol) was added, and the mixture was heated at reflux for 4 hr. A white precipitate was observed and the reaction was cooled to 25°C. Dimethylphthalate (11.4 mL, 0.0699 mol) was added and the mixture was again refluxed for 18 hr. After cooling to 25°C the precipitate was removed by filtration and washed with EtOAc. The filtrate was evaporated *in vacuo* and the residue was dissolved in THF (125 mL) and H<sub>2</sub>O (25 mL). To this solution was added solid Na<sub>2</sub>CO<sub>3</sub> (4.0 g, 0.0377 mol) and BOC<sub>2</sub>O (4.47 g, 0.020 mol) and the reaction was stirred for 18 hr. The THF was removed *in vacuo* and the mixture was partitioned with EtOAc and saturated NaHCO<sub>3</sub>. The EtOAc layer was washed with brine, dried with MgSO<sub>4</sub>, and evaporated *in vacuo* to obtain the title product after chromatography (silica gel, CH<sub>2</sub>Cl<sub>2</sub>:MeOH:NH<sub>4</sub>OH/ 97:3:0.3).

30    Step B:        Preparation of 4-[5-(2-amino-ethyl)-imidazol-1-ylmethyl]-2-fluoro-benzonitrile dihydrochloride

A solution of {2-[3-(4-cyano-3-fluoro-benzyl)-3H-imidazol-4-yl]-ethyl}-carbamic acid tert-butyl ester (1.0 g, 0.0029 mol) in EtOAc (30 mL) was cooled to -20°C and saturated with HCl gas. The cooling bath was removed and the reaction was stirred for 2 hr. The solvent was removed *in vacuo* to obtain the title compound which was used without further purification.

Step C: Preparation of 2-fluoro-4-[5-(2-morpholin-4-yl-ethyl)-imidazol-1-ylmethyl]-benzonitrile

To a solution of 4-[5-(2-amino-ethyl)-imidazol-1-ylmethyl]-2-fluoro-benzonitrile dihydrochloride (0.92 g, 0.0029 mol) in acetonitrile (150 mL) and triethylamine (3.2 mL) was added 2-bromoethyl ether (0.839 mL, 0.0067 mol) and the mixture was refluxed for 48 hr. The solvents were removed *in vacuo* and the residue was dissolved in EtOAc which was washed twice with 1M HCl (100 mL). The HCl layers were combined and adjusted to pH = 9 with solid Na<sub>2</sub>CO<sub>3</sub> and extraxcted 3 times with EtOAc. The EtOAc layers were combined and dried with brine and MgSO<sub>4</sub>. Removal of the EtOAc *in vacuo* yielded the title compound which was used as is in the next step.

Step D: Preparation of 2-(2,4-dichloro-phenylsulfanyl)-4-[5-(2-morpholin-4-yl-ethyl)-imidazol-1-ylmethyl]-benzonitrile

Following the procedure described in Example 14, Step A, the title compound was prepared using 2-fluoro-4-[5-(2-morpholin-4-yl-ethyl)-imidazol-1-ylmethyl]-benzonitrile (0.15 g, 0.477 mmol) and 2,4-dichlorothiophenol (0.086 g, 0.477 mmol).

FAB mass spectrum m/e 473 (M+1).

### EXAMPLE 16

#### Preparation of 4-[hydroxy-(3-methyl-3*H*-imidazol-4-yl)-methyl]-2-(naphthalen-2-yloxy)-benzonitrile hydrochloride

5

##### Step A: Preparation of 2-Fluoro-4-formylbenzonitrile

- 2-Fluoro-4-hydroxymethylbenzonitrile (Example 13, Step C) 10 g, 0,066 mol) and triethylamine (32.3 mL, 0.231 mol) were dissolved in CH<sub>2</sub>Cl<sub>2</sub> (100 mL)- DMSO (20 mL) at < 5°C. with stirring and treated dropwise with a solution of pyridine•SO<sub>3</sub> complex (31.5 g, 0.198 mol) in DMSO (70 mL) maintaining the reaction mixture temperature at <10°C. The reaction mixture was stirred at 5°C for 1 hr after the addition, then at 20°C. for 1 hr, then partitioned between CH<sub>2</sub>Cl<sub>2</sub> and H<sub>2</sub>O. The organic layer was separated, washed well with H<sub>2</sub>O, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration gave the title compound after purification by chromatography (silica gel, hexane: EtOAc, 3:1). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 10.06 (d, 1H, J = 2 Hz), 7.86 (dd, 1H, J = 5,8 Hz), 7.798 (dd, 1H, J = 1, 8 Hz), 7.728 (dd, 1H, J = 1, 8 Hz).

##### 20 Step B: Preparation of 2-fluoro-4-[hydroxy-(1-trityl-1*H*-imidazol-4-yl)-methyl]-benzonitrile

- To a solution of 4-iodo-1-trityl-1*H*-imidazole (5.00 g, 11.5 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (30 mL) was added a 3.0M solution of ethylmagnesium bromide (6.58 mL, 19.7 mmol) with stirring under Ar. After 3h, the reaction mixture was cooled to -78°C and a solution of 2-fluoro-4-formyl-benzonitrile (1.70g, 11.5 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) was added dropwise. The reaction was allowed to warm to RT over 2h, quenched with saturated NH<sub>4</sub>Cl solution, diluted with satd. NaHCO<sub>3</sub> solution to pH=8.5, and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3X). The combined organic layers were dried (MgSO<sub>4</sub>), concentrated and purified using SiO<sub>2</sub> chromatography (0-1% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to yield the title compound.

Step C: Preparation of acetic acid (4-cyano-3-fluoro-phenyl)-(1-trityl-1H-imidazol-4-yl)-methyl ester

2-Fluoro-4-[hydroxy-(1-trityl-1H-imidazol-4-yl)-methyl]-benzonitrile (4.05 g, 8.81 mmol), pyridine (2.14 mL, 26.4 mmol), and  
5 acetic anhydride (12.5 mL, 132 mmol) were stirred in anhydrous DMF (60 mL) for 3h under Ar. The reaction was concentrated *in vacuo*, diluted with EtOAc (250 mL), washed with H<sub>2</sub>O (2X), brine, dried (MgSO<sub>4</sub>) and concentrated to give the title compound.

10 Step D: Preparation of acetic acid (4-cyano-3-fluoro-phenyl)-(3-methyl-3H-imidazol-4-yl)-methyl ester

Acetic acid (4-cyano-3-fluoro-phenyl)-(1-trityl-1H-imidazol-4-yl)-methyl ester (4.60 g, 9.17 mmol) and dimethyl sulfate (0.83 mL, 8.81 mmol) were dissolved in EtOAc (20 mL) and heated at 60°C overnight  
15 under Ar. The reaction was concentrated *in vacuo*, diluted with MeOH (30 mL), and refluxed for 1h. Concentrated *in vacuo* and purified using SiO<sub>2</sub> chromatography (0.5 - 4% MeOH/CH<sub>2</sub>Cl<sub>2</sub> with NH<sub>4</sub>OH) to give the title compound.

20 Step E: Preparation of 2-fluoro-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile

Acetic acid (4-cyano-3-fluoro-phenyl)-(3-methyl-3H-imidazol-4-yl)-methyl ester (1.26 g, 4.59 mmol) and NaOH (5.5 mL, 5.5 mmol) were dissolved in THF (15 mL) and H<sub>2</sub>O (25 mL). After 1h, the  
25 reaction was diluted with satd. NaHCO<sub>3</sub> solution, extracted with CH<sub>2</sub>Cl<sub>2</sub> (3X), dried (MgSO<sub>4</sub>) and concentrated to give the title compound.

Step F: Preparation of 4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-2-(naphthalen-2-yloxy)-benzonitrile hydrochloride

30 2-Fluoro-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile (0.099 g, 0.428 mmol), 2-naphthol (0.062 g, 0.4287 mmol) and Cs<sub>2</sub>CO<sub>3</sub> (0.279 g, 0.856 mmol) were dissolved in anhydrous DMSO (5 mL) and heated at 80°C under Ar for 1.5h. The reaction was diluted with EtOAc, washed with satd. NaHCO<sub>3</sub> solution, water, and brine. The  
35 organic layer was dried (MgSO<sub>4</sub>), concentrated and purified using SiO<sub>2</sub>

chromatography (1-2.5% MeOH/CH<sub>2</sub>Cl<sub>2</sub>). The purified compound was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and treated with 1N HCl ethereal solution to give the title compound.

FAB MS (M+1) = 365.

#### EXAMPLE 17

- 10 Preparation of 4-[1-hydroxy-1-(3-methyl-3*H*-imidazol-4-yl)-ethyl]-2-(naphthalen-2-yloxy)-benzonitrile

Step A: Preparation of 4-(3-methyl-3*H*-imidazole-4-carbonyl)-2-(naphthalen-2-yloxy)-benzonitrile

- 15 2-Fluoro-4-[hydroxy-(3-methyl-3*H*-imidazol-4-yl)-methyl]-benzonitrile (as described in Example 16, Step E) (0.172 g, 0.743 mmol), 2-naphthol (0.107 g, 0.743 mmol) and Cs<sub>2</sub>CO<sub>3</sub> (0.727 g, 2.23 mmol) were dissolved in anhydrous DMF (5 mL) and heated at 60°C under Ar for 2 days. The reaction was diluted with EtOAc, washed with satd. NaHCO<sub>3</sub>  
20 solution, water, and brine. The organic layer was dried (MgSO<sub>4</sub>), concentrated and purified using SiO<sub>2</sub> chromatography (1-2% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to give the title compound.

- Step B: Preparation of 4-[1-hydroxy-1-(3-methyl-3*H*-imidazol-4-yl)-ethyl]-2-(naphthalen-2-yloxy)-benzonitrile

- 25 4-(3-Methyl-3*H*-imidazole-4-carbonyl)-2-(naphthalen-2-yloxy)-benzonitrile (0.109 g, 0.308 mmol) was dissolved in anhydrous THF (5 mL) and a 3.0 M solution of MeMgBr (0.35 mL, 1.05 mmol) was added and stirred at RT. The reaction was quenched with NH<sub>4</sub>Cl after  
30 1h, concentrated, diluted with EtOAc, washed with satd. NaHCO<sub>3</sub> solution, water, brine, dried (MgSO<sub>4</sub>) and concentrated to give the title compound. FT/ICR MS (M+1) = 370.

### EXAMPLE 18

#### Preparation of 4-imidazol-1-ylmethyl-2-[2-(2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

5

##### Step A: Preparation of 4-Bromo-3-fluorobenzoic acid

4-Bromo-3-fluorotoluene (40.0 g, 0.212 mol) was heated at 90° C in H<sub>2</sub>O (200 mL)-pyridine (200 mL) with mechanical stirring under Ar. Potassium permanganate (KMnO<sub>4</sub>) (67 g, 0.424 mol) was added portionwise over 3 h. After 4 h, an HPLC of a filtered sample indicated 50 % conversion to the acid. An additional 30 g of KMnO<sub>4</sub> was added and heating continued overnight. HPLC indicated 81% conversion. Further KMnO<sub>4</sub> was added portionwise with reaction monitoring by HPLC until > 95% conversion was obtained. The reaction mixture was filtered through Celite, the filter pad washed with H<sub>2</sub>O, aq NaOH and EtOH. The filtrate was concentrated to a small volume, then partitioned between 3N NaOH solution and diethyl ether. The aqueous basic layer was separated, cooled in an ice-H<sub>2</sub>O bath and acidified slowly with 6N HCl solution to precipitate the white solid product. This was collected by suction filtration and dried at 40 °C. in a vacuum oven overnight to give the title compound. mp 190 -192°C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.83 (dd, 1H, J = 2, 9 Hz), 7.78 (dd, 1H, J = 2, 8 Hz), 7.67 - 7.71 (m, 1H).

##### Step B: Preparation of 4-bromo-3-fluorobenzyl alcohol

4-Bromo-3-fluorobenzoic acid, as described above, (40.8 g, 0.187 mol) was dissolved in THF (250 ml) with magnetic stirring under Ar in an ice- H<sub>2</sub>O bath. The cloudy solution was treated dropwise with borane-THF complex (1 M) (374 mL, 0.374 mol) over a 1 h period maintaining the internal temperature at < 10°C. The reaction mixture was left to warm to ambient temperature overnight, then cooled in an

ice-H<sub>2</sub>O bath and treated dropwise with H<sub>2</sub>O ( 150 mL). The THF was removed on a rotary evaporator, and the residue partitioned between EtOAc and H<sub>2</sub>O. The aqueous layer was extracted with EtOAc (3 x 100 mL), the organic layers combined, washed with brine, and dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give the title compound as an oil which solidified on standing.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.52 (t, 1H, J = 8 Hz), 7.16 (d, 1H, J = 9 Hz), 7.02 (d, 1H, J = 8 Hz), 4.67 (s, 2H), 1.47 (br s, 1H).

10 Step C: Preparation of 2-fluoro-4-hydroxymethylbenzonitrile  
4-Bromo-3-fluorobenzyl alcohol, as described in Step B above, (20 g, 0.097 mol) was dissolved in DMF (100 mL) then placed under high vacuum for 15 min. The solution was then purged with Ar for 15 min. While purging continued, zinc cyanide ( 8 g, 0.068 mol) and the catalyst, Pd[(PPh<sub>2</sub>)<sub>4</sub>], (5.63 g, 0.0049 mol) were added. The reaction mixture was heated at 95°C under Ar for 18 h, then cooled to ambient temperature and added to H<sub>2</sub>O. The mixture was extracted with EtOAc, then washed with 1M HCl, H<sub>2</sub>O, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave the title compound as a white solid after chromatography (silica gel, hexane: EtOAc, 6.5:3.5).

15 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.61 (t, 1H, J = 8 Hz), 7.23 - 7.29 (m, 2H), 4.80 (d, 2H, J = 6 Hz), 1.93 (t, 1H, J = 6Hz).

Step D: Preparation of 4-Bromomethyl-2-fluoro-benzonitrile

25 N-Bromosuccinimide ( 6.6 g, 0.037 mol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (150 mL), cooled to 0°C and treated with dimethylsulfide (3.27 mL, 0.0446 mol). The solution was cooled to -20°C then treated dropwise with a solution of 2-fluoro-4-hydroxymethylbenzonitrile, as described in Step C above, (3.74 g, 0.0248 mol) in CH<sub>2</sub>Cl<sub>2</sub> (30 mL). After the addition, the reaction mixture was stirred at 0°C for 2 h then left to warm to ambient temperature overnight. The reaction mixture was added to ice/H<sub>2</sub>O, extracted with EtOAc, the organic layer separated, washed with brine and dried (MgSO<sub>4</sub>). Filtration and concentration to dryness

30

gave the title compound which was purified after chromatography (silica gel, 5-10% EtOAc/ hexane).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  7.61 (dd, 1H,  $J = 8, 8$  Hz), 7.26 - 7.30 (m, 2H), 4.45 (s, 2H).

5

Step E: Preparation of 2-fluoro-4-imidazol-1-ylmethyl-benzonitrile

4-Bromomethyl-2-fluoro-benzonitrile, as described in Step D above, (3.44g, 16.0 mmol) and imidazole (5.47 g, 80.3 mmol) were dissolved in DMF (40 mL) and stirred at ambient temperature for 2 h.

- 10 The DMF was removed *in vacuo* and the residue was partitioned between EtOAc (300 mL) and aqueous saturated  $\text{NaHCO}_3$  solution. The organic layer was separated, washed with  $\text{NaHCO}_3$  solution,  $\text{H}_2\text{O}$ , brine, and dried ( $\text{MgSO}_4$ ). Filtration and concentration to dryness gave the title compound after chromatography (silica gel, 1-2%  
15  $\text{CH}_3\text{OH}/\text{CH}_2\text{Cl}_2$ ).

$^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  7.62 (dd, 1H,  $J = 8.5, 9.5$  Hz), 7.57 (s, 1H), 7.16 (s, 1H), 7.00 (d, 1H,  $J = 8.5$  Hz), 6.94 (d, 1H,  $J = 9.5$  Hz), 6.91 (s, 1H), 5.21 (s, 2H).

Step F: Preparation of 2-(2-oxo-piperidin-1-yl)-phenol

- 20 To a solution of 2-aminophenol (1.09 g, 0.01 mol),  $\text{Et}_3\text{N}$  (4.46 mL, 0.032 mol) and 4-dimethylaminopyridine (0.122 g, 0.001 mol) in  $\text{CHCl}_3$  (20 mL) in an ice- $\text{H}_2\text{O}$  bath was added dropwise 5-bromovaleryl chloride (2.95 mL, 0.022 mol) with stirring. After 2 hr, the reaction mixture was washed with 1N HCl until the aqueous layer was acidic,  
25 then washed with  $\text{H}_2\text{O}$ , aqueous saturated  $\text{NaHCO}_3$  solution, brine, and dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration to dryness gave a yellow oil which solidified on standing. This bisacylated product was dissolved in DMF (20 mL) and heated at  $80^\circ\text{C}$  with cesium carbonate (4.89 g, 0.015 mol) for 3 hr, then partitioned between EtOAc and ice water. The  
30 aqueous layer was extracted with EtOAc (3 x), the organics combined, washed with  $\text{H}_2\text{O}$ , aqueous saturated  $\text{NaHCO}_3$  solution, brine, and dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration to dryness gave a crude product which was treated with 1N NaOH solution (12 mL, 0.012 mol) in THF (20 mL)-  $\text{H}_2\text{O}$  (10 mL) with stirring at ambient temperature for 2 hr. The  
35 reaction mixture was neutralized with 1N HCl (12 mL, 0.012 mol),

concentrated, and extracted with EtOAc (3x), the organics combined, washed with H<sub>2</sub>O, aqueous saturated NaHCO<sub>3</sub> solution, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave the title compound.

5

Step G: Preparation of 4-imidazol-1-ylmethyl-2-[2-(2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

2-Fluoro-4-imidazol-1-ylmethyl-benzonitrile (as described in Step E above) (0.080 g, 0.4 mmol), 2-(2-oxo-piperidin-1-yl)-phenol (as described in Step F above) (0.091 g, 0.5 mmol) and cesium carbonate (0.261 g, 0.8 mmol) were combined in DMF (2.0 mL) and heated at 50°C for 18 hr. The reaction mixture was partitioned between EtOAc and a minimum volume of H<sub>2</sub>O. Additional product was salted out from the aqueous layer with solid NaCl, and extracted into EtOAc. The organic layers were combined, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to give the title compound after RP HPLC on a Waters Prep Pak column eluting with a 0.1%TFA/H<sub>2</sub>O: 0.1%TFA/CH<sub>3</sub>CN gradient followed by conversion to the free base.

FAB MS 373 (M+1).

#### EXAMPLE 19

25 Preparation of 4-imidazol-1-ylmethyl-2-[2-(3-methyl-2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

Step A: Preparation of 2-(3-methyl-2-oxo-piperidin-1-yl)-phenol

Lithium diethylamide (2M solution in THF) (3.92 mL, 7.84 mmol) was added to a solution of 2-(2-oxo-piperidin-1-yl)-phenol (as described in Example 18, Step F) (0.50 g, 2.61 mmol) in THF (5 mL) at -78°C with stirring under Ar. After 30 min, iodomethane (0.488 mL, 7.84 mmol) was added and the reaction left to come to room temperature overnight. The reaction was treated with H<sub>2</sub>O, concentrated to remove the THF, then partitioned between diethyl ether and H<sub>2</sub>O. The organic

layer was separated, washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to dryness to give the title compound after chromatography (silica gel, 1% CH<sub>3</sub>OH, 29% EtOAc, 70% hexane).

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.14 - 7.23 (m, 3H), 7.52 (dd, 1H, J = 1.5, 8 Hz), 6.93 - 6.98 (m, 1H), 3.70 - 3.85 (m, 2H), 2.63 - 2.72 (m, 1H), 2.08 - 2.17 (m, 1H), 1.89 - 2.05 (m, 2H), 1.60 - 1.70 (m, 1H), 1.36 (d, 3H, J = 7 Hz).

Step B: Preparation of 4-imidazol-1-ylmethyl-2-[2-(3-methyl-2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

Following the procedure outlined in Example 18, Step G, but substituting the phenol of Step A for the phenol used in Example 18, Step G, the title compound was prepared.

FAB MS 387(M+1).

EXAMPLE 20

Preparation of 4-imidazol-1-ylmethyl-2-[2-(2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

Step A: Preparation of 4-Bromo-3-fluorobenzoic acid

4-Bromo-3-fluorotoluene (40.0 g, 0.212 mol) was heated at 90° C in H<sub>2</sub>O (200 mL)-pyridine (200 mL) with mechanical stirring under Ar. Potassium permanganate (KMnO<sub>4</sub>) (67 g, 0.424 mol) was added portionwise over 3 h. After 4 h, an HPLC of a filtered sample indicated 50 % conversion to the acid. An additional 30 g of KMnO<sub>4</sub> was added and heating continued overnight. HPLC indicated 81% conversion. Further KMnO<sub>4</sub> was added portionwise with reaction monitoring by HPLC until > 95% conversion was obtained. The reaction mixture was filtered through Celite, the filter pad washed with H<sub>2</sub>O, aq NaOH and EtOH. The filtrate was concentrated to a small volume, then partitioned between 3N NaOH solution and diethyl ether. The aqueous basic layer was separated, cooled in an ice- H<sub>2</sub>O bath and acidified slowly with 6N

HCl solution to precipitate the white solid product. This was collected by suction filtration and dried at 40 °C. in a vacuum oven overnight to give the title compound. mp 190 -192°C.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.83 (dd, 1H, J = 2, 9 Hz), 7.78 (dd, 1H, J = 2, 8 Hz),  
5 7.67 - 7.71 (m, 1H).

Step B: Preparation of 4-bromo-3-fluorobenzyl alcohol

4-Bromo-3-fluorobenzoic acid, as described above, (40.8 g, 0.187 mol) was dissolved in THF (250 ml) with magnetic stirring under Ar in an ice- H<sub>2</sub>O bath. The cloudy solution was treated dropwise with  
10 borane-THF complex (1 M) (374 mL, 0.374 mol) over a 1 h period maintaining the internal temperature at < 10°C. The reaction mixture was left to warm to ambient temperature overnight, then cooled in an ice-H<sub>2</sub>O bath and treated dropwise with H<sub>2</sub>O ( 150 mL). The THF was  
15 removed on a rotary evaporator, and the residue partitioned between EtOAc and H<sub>2</sub>O. The aqueous layer was extracted with EtOAc (3 x 100 mL), the organic layers combined, washed with brine, and dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give the title compound as an oil which solidified on standing.  
20 <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.52 (t, 1H, J = 8 Hz), 7.16 (d, 1H, J = 9 Hz), 7.02 (d, 1H, J = 8 Hz), 4.67 (s, 2H), 1.47 ( br s, 1H).

Step C: Preparation of 2-fluoro-4-hydroxymethylbenzonitrile

4-Bromo-3-fluorobenzyl alcohol, as described in Step B  
25 above, (20 g, 0.097 mol) was dissolved in DMF (100 mL) then placed under high vacuum for 15 min. The solution was then purged with Ar for 15 min. While purging continued, zinc cyanide ( 8 g, 0.068 mol) and the catalyst, Pd[(PPh<sub>2</sub>)]<sub>4</sub>, (5.63 g, 0.0049 mol) were added. The reaction mixture was heated at 95°C. under Ar for 18 h, then cooled to ambient  
30 temperature and added to H<sub>2</sub>O. The mixture was extracted with EtOAc, then washed with 1M HCl, H<sub>2</sub>O, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave the title compound as a white solid after chromatography (silica gel, hexane: EtOAc, 6.5:3.5).  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.61 (t, 1H, J = 8 Hz), 7.23 - 7.29 (m, 2H), 4.80 (d, 2H, J  
35 = 6 Hz), 1.93 ( t, 1H, J = 6Hz).

Step D: Preparation of 4-Bromomethyl-2-fluoro-benzonitrile

N-Bromosuccinimide ( 6.6 g, 0.037 mol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (150 mL), cooled to 0°C and treated with dimethylsulfide (3.27 mL, 0.0446 mol). The solution was cooled to -20°C then treated dropwise with a solution of 2-fluoro-4-hydroxymethylbenzonitrile, as described in Step C above, (3.74 g, 0.0248 mol) in CH<sub>2</sub>Cl<sub>2</sub> (30 mL). After the addition, the reaction mixture was stirred at 0°C for 2 h then left to warm to ambient temperature overnight. The reaction mixture was added to ice/H<sub>2</sub>O, extracted with EtOAc, the organic layer separated, washed with brine and dried (MgSO<sub>4</sub>). Filtration and concentration to dryness gave the title compound which was purified after chromatography (silica gel, 5-10% EtOAc/ hexane).  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.61 (dd, 1H, J = 8, 8 Hz), 7.26 - 7.30 (m, 2H), 4.45 (s, 2H).

Step E: Preparation of 2-fluoro-4-imidazol-1-ylmethyl-benzonitrile

4-Bromomethyl-2-fluoro-benzonitrile, as described in Step D above, (3.44g, 16.0 mmol) and imidazole (5.47 g, 80.3 mmol) were dissolved in DMF (40 mL) and stirred at ambient temperature for 2 h. The DMF was removed *in vacuo* and the residue was partitioned between EtOAc (300 mL) and aqueous saturated NaHCO<sub>3</sub> solution. The organic layer was separated, washed with NaHCO<sub>3</sub> solution, H<sub>2</sub>O, brine, and dried (MgSO<sub>4</sub>). Filtration and concentration to dryness gave the title compound after chromatography (silica gel, 1-2% CH<sub>3</sub>OH/CH<sub>2</sub>Cl<sub>2</sub>).  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 7.62 (dd, 1H, J = 8.5, 9.5 Hz), 7.57 (s, 1H), 7.16 (s, 1H), 7.00 (d, 1H, J = 8.5 Hz), 6.94 (d, 1H, J = 9.5 Hz), 6.91 (s, 1H), 5.21 (s, 2H).

Step F: Preparation of 2-(2-oxo-piperidin-1-yl)-phenol

To a solution of 2-aminophenol (1.09 g, 0.01 mol), Et<sub>3</sub>N (4.46 mL, 0.032 mol) and 4-dimethylaminopyridine (0.122 g, 0.001 mol) in CHCl<sub>3</sub> (20 mL) in an ice-H<sub>2</sub>O bath was added dropwise 5-bromovaleryl chloride (2.95 mL, 0.022 mol) with stirring. After 2 hr, the reaction mixture was washed with 1N HCl until the aqueous layer was acidic,

then washed with H<sub>2</sub>O, aqueous saturated NaHCO<sub>3</sub> solution, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave a yellow oil which solidified on standing. This bisacylated product was dissolved in DMF (20 mL) and heated at 80°C with cesium carbonate (4.89 g, 0.015 mol) for 3 hr, then partitioned between EtOAc and ice water. The aqueous layer was extracted with EtOAc (3 x), the organics combined, washed with H<sub>2</sub>O, aqueous saturated NaHCO<sub>3</sub> solution, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave a crude product which was treated with 1N NaOH solution (12 mL, 0.012 mol) in THF (20 mL)- H<sub>2</sub>O (10 mL) with stirring at ambient temperature for 2 hr. The reaction mixture was neutralized with 1N HCl (12 mL, 0.012 mol), concentrated, and extracted with EtOAc (3x), the organics combined, washed with H<sub>2</sub>O, aqueous saturated NaHCO<sub>3</sub> solution, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration to dryness gave the title compound.

Step G: Preparation of 4-imidazol-1-ylmethyl-2-[2-(2-oxo-piperidin-1-yl)-phenoxy]-benzonitrile

2-Fluoro-4-imidazol-1-ylmethyl-benzonitrile (as described in Step E above) (0.080 g, 0.4 mmol), 2-(2-oxo-piperidin-1-yl)-phenol (as described in Step F above) (0.091 g, 0.5 mmol) and cesium carbonate (0.261 g, 0.8 mmol) were combined in DMF (2.0 mL) and heated at 50°C for 18 hr. The reaction mixture was partitioned between EtOAc and a minimum volume of H<sub>2</sub>O. Additional product was salted out from the aqueous layer with solid NaCl, and extracted into EtOAc. The organic layers were combined, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to give the title compound after RP HPLC on a Waters Prep Pak column eluting with a 0.1%TFA/H<sub>2</sub>O: 0.1%TFA/CH<sub>3</sub>CN gradient followed by conversion to the free base.

FAB MS 373 (M+1).

### EXAMPLE 20A

Preparation of 4-[5-(2-amino-ethyl)-2-methyl-imidazol-1-ylmethyl]-2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-benzonitrile  
dihydrochloride

---

5

Step A: Preparation of {2-[3-(4-cyano-3-fluoro-benzyl)-3H-imidazol-4-yl]-ethyl}-carbamic acid tert-butyl ester

---

- To a solution of N<sup>1</sup>-pivaloyloxymethyl-N<sup>α</sup>-phthaloyl-histamine (J. C. Emmett, F. H. Holloway, and J. L. Turner, *J. Chem. Soc., Perkin Trans. 1*, 1341, (1979)) (4.59 g, 0.0124 mmol) in acetonitrile (40 mL) was added 2-fluoro-4-imidazol-1-ylmethyl-benzonitrile (as described in Example 20, Step E) (2.8 g, 0.013 mmol) and the mixture was heated to reflux for 18 hr. A white solid precipitate formed which after cooling to 0°C was collected by filtration to obtain the quaternary salt.
- 10 This intermediate was dissolved in EtOH (100 mL), hydrazine (1.46 mL, 0.046 mmol) was added, and the mixture was heated at reflux for 4 hr. A white precipitate was observed and the reaction was cooled to 25°C. Dimethylphthalate (11.4 mL, 0.0699 mmol) was added and the mixture was again refluxed for 18 hr. After cooling to 25°C the precipitate was removed by filtration and washed with EtOAc. The filtrate was evaporated in vacuo and the residue was dissolved in THF (125 mL) and H<sub>2</sub>O (25 mL). To this solution was added solid Na<sub>2</sub>CO<sub>3</sub> (4.0 g, 0.0377 mmol) and BOC<sub>2</sub>O (4.47 g, 0.020 mmol) and the reaction was stirred for 18 hr. The THF was removed in vacuo and the mixture was partitioned with EtOAc and saturated NaHCO<sub>3</sub>. The EtOAc layer was washed with brine, dried with MgSO<sub>4</sub>, and evaporated in vacuo to obtain the title product after chromatography (silica gel, CH<sub>2</sub>Cl<sub>2</sub>:MeOH:NH<sub>4</sub>OH/97:3:0.3).
- 15 20 25

- 30 Step B: Preparation of [2-(3-{4-cyano-3-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-benzyl}-2-methyl-3H-imidazol-4-yl)-ethyl]-carbamic acid tert-butyl ester
- 

- Following the procedure outlined in Example 19, but using {2-[3-(4-cyano-3-fluoro-benzyl)-3H-imidazol-4-yl]-ethyl}-carbamic acid tert-butyl ester, prepared as described in Step A (0.60 g, 1.67 mmol) and
- 35

3-ethyl-3-(3-hydroxy-phenyl)-1-methyl-azepan-2-one, commercially available from Maybridge(0.41 g, 1.67 mmol), the title compound was obtained after chromatography (CH<sub>2</sub>Cl<sub>2</sub>: CH<sub>3</sub>OH: NH<sub>4</sub>OH, 98:2:0.2).

5 **Step C:** Preparation of 4-[5-(2-amino-ethyl)-2-methyl-imidazol-1-ylmethyl]-2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-benzonitrile dihydrochloride

To a solution of [2-(3-{4-cyano-3-[3-(3-ethyl-1-methyl-2-oxoazepan-3-yl)-phenoxy]-benzyl]-2-methyl-3H-imidazol-4-yl)-ethyl]-carbamic acid tert-butyl ester (as described in Step B above) (0.2 g, 0.41 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (6.0 mL) was added TFA (3.0 mL) and the solution was stirred for 0.5 hr. The solvents were removed *in vacuo* and the crude product was purified by preparative HPLC. Conversion to the HCl salt yielded the title compound.

### EXAMPLE 22

Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-[hydroxy-(3-methyl-3-*H*-imidazol-4-yl)-methyl]-benzonitrile

- 5    Step A:      Preparation of 2-Fluoro-4-formylbenzonitrile
- 2-Fluoro-4-hydroxymethylbenzonitrile (as described in Example 20, Step C) (10 g, 0.066 mol) and triethylamine (32.3 mL, 0.231 mol) were dissolved in CH<sub>2</sub>Cl<sub>2</sub> (100 mL)- DMSO (20 mL) at < 5°C with stirring and treated dropwise with a solution of pyridine•SO<sub>3</sub> complex
- 10 (31.5 g, 0.198 mol) in DMSO (70 mL) maintaining the reaction mixture temperature at <10°C. The reaction mixture was stirred at 5°C for 1 hr after the addition, then at 20°C. for 1 hr, then partitioned between CH<sub>2</sub>Cl<sub>2</sub> and H<sub>2</sub>O. The organic layer was separated, washed well with H<sub>2</sub>O, brine, and dried (Na<sub>2</sub>SO<sub>4</sub>). Filtration and concentration gave the
- 15 title compound after purification by chromatography (silica gel, hexane: EtOAc, 3:1).  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 10.06 (d, 1H, J = 2 Hz), 7.86 (dd, 1H, J = 5,8 Hz), 7.798 (dd, 1H, J = 1, 8 Hz), 7.728 (dd, 1H, J = 1, 8 Hz).
- 20    Step B:      Preparation of 2-fluoro-4-[hydroxy-(1-trityl-1H-imidazol-4-yl)-methyl]-benzonitrile
- To a solution of 4-iodo-1-trityl-1*H*-imidazole (5.00 g, 11.5 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (30 mL) was added a 3.0M solution of ethylmagnesium bromide (6.58 mL, 19.7 mmol) with stirring under Ar.
- 25 After 3h, the reaction mixture was cooled to -78°C and a solution of 2-fluoro-4-formyl-benzonitrile (as described in Step A above) (1.70g, 11.5 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) was added dropwise. The reaction was allowed to warm to room temperature over 2h, quenched with saturated NH<sub>4</sub>Cl solution, diluted with satd. NaHCO<sub>3</sub> solution to
- 30 pH=8.5, and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3X). The combined organic layers were dried (MgSO<sub>4</sub>), concentrated and purified using SiO<sub>2</sub> chromatography (0-1% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to yield the title compound.

- Step C: Preparation of acetic acid (4-cyano-3-fluoro-phenyl)-(1-trityl-1H-imidazol-4-yl)-methyl ester
- 2-Fluoro-4-[hydroxy-(1-trityl-1H-imidazol-4-yl)-methyl]-benzonitrile (as described in Step B above) (4.05 g, 8.81 mmol), pyridine (2.14 mL, 26.4 mmol), and acetic anhydride (12.5 mL, 132 mmol) were stirred in anhydrous DMF (60 mL) for 3h under Ar. The reaction was concentrated *in vacuo*, diluted with EtOAc (250 mL), washed with H<sub>2</sub>O (2X), brine, dried (MgSO<sub>4</sub>) and concentrated to give the title compound.
- 5
- 10 Step D: Preparation of acetic acid (4-cyano-3-fluoro-phenyl)-(3-methyl-3H-imidazol-4-yl)-methyl ester
- Acetic acid (4-cyano-3-fluoro-phenyl)-(1-trityl-1H-imidazol-4-yl)-methyl ester (as described in Step C above) (4.60 g, 9.17 mmol) and dimethyl sulfate (0.83 mL, 8.81 mmol) were dissolved in EtOAc (20 mL) and heated at 60°C overnight under Ar. The reaction was concentrated in *vacuo*, diluted with MeOH (30 mL), and refluxed for 1h. Concentrated in *vacuo* and purified using SiO<sub>2</sub> chromatography (0.5 - 4% MeOH/CH<sub>2</sub>Cl<sub>2</sub> with NH<sub>4</sub>OH) to give the title compound.
- 15
- 20 Step E: Preparation of 2-fluoro-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile
- Acetic acid (4-cyano-3-fluoro-phenyl)-(3-methyl-3H-imidazol-4-yl)-methyl ester (as described in Step C above) (1.26 g, 4.59 mmol) and NaOH (5.5 mL, 5.5 mmol) were dissolved in THF (15 mL) and H<sub>2</sub>O (25 mL). After 1h, the reaction was diluted with satd. NaHCO<sub>3</sub> solution, extracted with CH<sub>2</sub>Cl<sub>2</sub> (3X), dried (MgSO<sub>4</sub>) and concentrated to give the title compound.
- 25
- 30 Step F: Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile
- 2-Fluoro-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile (as described in Step E above) (0.162 g, 0.700 mmol), 3-ethyl-3-(3-hydroxy-phenyl)-1-methyl-azepan-2-one, commercially available from Maybridge (0.173 g, 0.700 mmol) and KF•Al<sub>2</sub>O<sub>3</sub> (0.208 g) and 18-
- 35

Crown-6 (0.017 g, 0.064 mmol) were dissolved in anhydrous CH<sub>3</sub>CN (7 mL) and refluxed under Ar for 24 h. The reaction was filtered, concentrated and purified using SiO<sub>2</sub> chromatography (1-3% MeOH/CH<sub>2</sub>Cl<sub>2</sub>).

5 FAB MS (M+1) = 459.

#### EXAMPLE 22A

Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-benzyl]-4-(3-methyl-3H-imidazole-4-carbonyl)-benzonitrile trifluoroacetate

10

Step A: Preparation of 2-fluoro-4-[amino-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile

2-Fluoro-4-[hydroxy-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile, prepared as described in Example 22, Step E (0.542 g, 2.31 mmol) was dissolved in SOCl<sub>2</sub> (15 mL) and stirred at room temperature for 2h under Ar<sub>2</sub>. The solution was concentrated *in vacuo* and azeotroped with CH<sub>2</sub>Cl<sub>2</sub> (3X). The solid was dissolved in CHCl<sub>3</sub> (30 mL) and cooled to -78°C. NH<sub>3</sub> (g) was bubbled through the solution and stirred for 16 h while warming to room temperature under Ar. After concentration to dryness and chromatography (silica gel, 1-2% CH<sub>3</sub>OH/CH<sub>2</sub>Cl<sub>2</sub> with NH<sub>3</sub>), the title compound was obtained.

20

Step B: Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-benzyl]-4-(3-methyl-3H-imidazole-4-carbonyl)-benzonitrile trifluoroacetate

25

2-Fluoro-4-[amino-(3-methyl-3H-imidazol-4-yl)-methyl]-benzonitrile (as described in Step A above) (0.012 g, 0.052 mmol), 3-ethyl-3-(3-hydroxy-phenyl)-1-methyl-azepan-2-one, commercially available from Maybridge (0.014 g, 0.056 mmol), KF•Al<sub>2</sub>O<sub>3</sub> (0.020 g) and 18-Crown-6 (0.001 g) were dissolved in anhydrous CH<sub>3</sub>CN (2 mL) and refluxed under Ar for 24 h. The reaction was filtered, concentrated and purified using RP LC on a VYDAC column eluting with 0.1%TFA/H<sub>2</sub>O: 0.1%TFA/CH<sub>3</sub>CN to give the title compound.

FAB MS (M+1) = 457.

30

### EXAMPLE 23

Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-[1-hydroxy-1-(3-methyl-3*H*-imidazol-4-yl)-ethyl]-benzonitrile

5

2-[3-(3-Ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-(3-methyl-3*H*-imidazole-4-carbonyl)-benzonitrile (prepared as described in Example 22A) (0.216 g, 0.473 mmol) was dissolved in anhydrous THF (10 mL) and a 3.0 M solution of MeMgBr (1.10 mL, 3.30 mmol) was added and stirred at RT. The reaction was quenched with NH<sub>4</sub>Cl after 1h, concentrated, diluted with EtOAc, washed with satd. NaHCO<sub>3</sub> solution, water, brine, dried (MgSO<sub>4</sub>), concentrated and purified using SiO<sub>2</sub> chromatography (1-3% MeOH/CH<sub>2</sub>Cl<sub>2</sub> w/NH<sub>4</sub>OH) to give the title compound. FT/ICR MS (M+1) = 473.

15

### EXAMPLE 24

Preparation of 2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-[1-amino-1-(3-methyl-3*H*-imidazol-4-yl)-ethyl]-benzonitrile

20

2-[3-(3-ethyl-1-methyl-2-oxo-azepan-3-yl)-phenoxy]-4-[1-hydroxy-1-(3-methyl-3*H*-imidazol-4-yl)-ethyl]-benzonitrile (prepared as described in Example 23) (0.099 g, 0.209 mmol) was dissolved in SOCl<sub>2</sub> (5 mL) and stirred at RT for 2h. The solution was concentrated *in vacuo* and azeotroped with anhydrous CH<sub>2</sub>Cl<sub>2</sub> (3X). The solid was dissolved in CHCl<sub>3</sub> (5 mL) and cooled to -78°C. NH<sub>3</sub> (g) was bubbled through the solution and stirred for 2h while warming to RT under Ar. The solution was concentrated *in vacuo* and purified using reverse phase chromatography (95/5 - 5/95 H<sub>2</sub>O/CH<sub>3</sub>CN with 0.1% TFA, flow = 65 mL/min). The compound was converted to its free base using saturated NaHCO<sub>3</sub> solution, extracted with CH<sub>2</sub>Cl<sub>2</sub> (3x), dried (MgSO<sub>4</sub>), filtered and treated with 1N HCl ethereal solution to give the title compound. FAB MS (M+1) = 472.

The four individual diastereomers of the title compound were prepared by the methods described in examples 22, 23 and 24 using chiral 3-ethyl-3-(3-hydroxy-phenyl)-1-methyl-azepan-2-one (the racemate was commercially obtained from Maybridge and the enantiomers separated on a chiral column) in the Example 22A, Step B reaction, and subsequently resolving the diastereomers by purification of the enantiomers at the amino group of the product from the eventual Example 24 reaction using chiral HPLC.

#### EXAMPLE 24A

##### Preparation of 1-(4-cyanobenzyl)-5-chloromethyl imidazole HCl salt

###### Step 1: Preparation of 4-Cyanobenzylamine

Method 1 (Hydrochloride salt): A 72 liter vessel was charged with 190 proof ethanol (14.4 L) followed by the addition of 4-cyanobenzylbromide (2.98 kg) and HMTA (2.18 kg) at ambient temperature. The mixture was heated to about 72-75°C over about 60 min. On warming, the solution thickens and additional ethanol (1.0 liter) was added to facilitate stirring. The batch was aged at about 72-75°C for about 30 min.

The mixture was allowed to cool to about 20°C over about 60 min, and HCl gas (2.20 kg) was sparged into the slurry over about 4 hours during which time the temperature rose to about 65°C. The mixture was heated to about 70-72°C and aged for about 1 hour. The slurry was cooled to about 30°C and ethyl acetate (22.3 L) added over about 30 min. The slurry was cooled to about -5°C over about 40 min and aged at about -3 to about -5°C for about 30 min. The mixture was filtered and the crystalline solid was washed with chilled ethyl acetate (3 x 3 L). The solid was dried under a N<sub>2</sub> stream for about 1 hour before charging to a 50 liter vessel containing water (5.5 L). The pH was adjusted to about 10-10.5 with 50% NaOH (4.0 kg) maintaining the internal temperature below about 30°C. At about 25°C, methylene chloride (2.8 L) was added and stirring continued for about 15 min. The layers were allowed to

settle and the lower organic layer was removed. The aqueous layer was extracted with methylene chloride (2 x 2.2 L). The combined organic layers were dried over potassium carbonate (650 g). The carbonate was removed via filtration and the filtrate concentrated in vacuo at about 5 25°C to give a free base as a yellow oil.

The oil was transferred to a 50 liter vessel with the aid of ethanol (1.8 L). Ethyl acetate (4.1 L) was added at about 25°C. The solution was cooled to about 15°C and HCl gas (600 g) was sparged in over about 3 hours, while keeping batch temperature below about 40°C. 10 At about 20-25°C, ethyl acetate (5.8 L) was added to the slurry, followed by cooling to about -5°C over about 1 hour. The slurry was aged at about -5°C for about 1 hour and the solids isolated via filtration. The cake was washed with a chilled mixture of EtOAc/EtOH (9:1 v/v) (1 x 3.8 L), then the cake was washed with chilled EtOAc (2 x 3.8 L). The solids were 15 dried in vacuo at about 25°C to provide the above-titled compound. <sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>): δ 7.83-7.79 (d, 2H), 7.60-7.57 (d, 2H), 4.79 (s, 2H), 4.25 (s, 2H); <sup>13</sup>C NMR (62.9 MHz, CDCl<sub>3</sub>): δ 149.9, 139.8, 134.2, 131.2, 119.7, 113.4, 49.9, 49.5, 49.2, 48.8, 48.5, 48.2, 43.8.

20 Method 2 (phosphate salt): A slurry of HMTA in 2.5 L EtOH was added gradually over about 30 min to about 60 min to a stirred slurry of cyanobenzyl-bromide in 3.5 L EtOH and maintained at about 48-53°C with heating & cooling in a 22L neck flask (small exotherm). Then the transfer of HMTA to the reaction mixture was completed with the use of 25 1.0 L EtOH. The reaction mixture was heated to about 68-73°C and aged at about 68-73°C for about 90 min. The reaction mixture was a slurry containing a granular precipitate which quickly settled when stirring stopped.

The mixture was cooled to a temperature of about 50°C to 30 about 55°C. Propionic acid was added to the mixture and the mixture was heated and maintained at a temperature of about 50°C to about 55°C. Phosphoric acid was gradually added over about 5 min to about 10 min, maintaining the reaction mixture below about 65°C to form a precipitate-containing mixture. Then the mixture was gradually warmed to about 35 65°C to about 70°C over about 30 min and aged at about 65°C to about 70°C

for about 30 min. The mixture was then gradually cooled to about 20-25°C over about 1 hour and aged at about 20-25°C for about 1 hour.

The reaction slurry was then filtered. The filter cake was washed four times with EtOH, using the following sequence, 2.5 L each time. The filter cake was then washed with water five times, using 300 mL each time. Finally, the filter cake was washed twice with MeCN (1.0 L each time) and the above identified compound was obtained.

Step 2:      Preparation of 1-(4-Cyanobenzyl)-2-Mercapto-5-Hydroxymethylimidazole

7% water in acetonitrile (50 mL) was added to a 250 mL roundbottom flask. Next, an amine phosphate salt (12.49 g), prepared as described in Step 1, was added to the flask. Next potassium thiocyanate (6.04 g) and dihydroxyacetone (5.61 g) was added. Lastly, propionic acid (10.0 mL) was added. Acetonitrile/water 93:7 (25 mL) was used to rinse down the sides of the flask. This mixture was then heated to 60°C, aged for about 30 minutes and seeded with 1% thioimidazole. The mixture was then aged for about 1.5 to about 2 hours at 60°C. Next, the mixture was heated to 70°C, and aged for 2 hours. The temperature of the mixture was then cooled to room temperature and was aged overnight. The thioimidazole product was obtained by vacuum filtration. The filter cake was washed four times acetonitrile (25 mL each time) until the filtrates became nearly colorless. Then the filter cake was washed three times with water (approximately 25-50 mL each time) and dried in vacuo to obtain the above-identified compound.

Step 3:      Preparation of 1-(4-Cyanobenzyl)-5-Hydroxymethylimidazole

A 1L flask with cooling/heating jacket and glass stirrer (Lab-Max) was charged with water (200 mL) at 25°C. The thioimidazole (90.27 g), prepared as described in Step 2, was added, followed by acetic acid (120 mL) and water (50 mL) to form a pale pink slurry. The reaction was warmed to 40°C over 10 minutes. Hydrogen peroxide (90.0 g) was added slowly over 2 hours by automatic pump maintaining a temperature of 35-45°C. The temperature was lowered to 25°C and the solution aged for 1 hour.

The solution was cooled to 20°C and quenched by slowly adding 20% aqueous Na<sub>2</sub>SO<sub>3</sub> (25 mL) maintaining the temperature at less than 25°C. The solution was filtered through a bed of DARCO G-60 (9.0 g) over a bed of SolkaFlok (1.9 g) in a sintered glass funnel. The bed  
5 was washed with 25 mL of 10% acetic acid in water.

The combined filtrates were cooled to 15°C and a 25% aqueous ammonia was added over a 30 minute period, maintaining the temperature below 25°C, to a pH of 9.3. The yellowish slurry was aged overnight at 23°C (room temperature). The solids were isolated via  
10 vacuum filtration. The cake (100 mL wet volume) was washed with 2 x 250 mL 5% ammonia (25%) in water, followed by 100 mL of ethyl acetate. The wet cake was dried with vacuum/N<sub>2</sub> flow and the above-titled compound was obtained.

<sup>1</sup>H NMR (250 MHz, CDCl<sub>3</sub>): δ 7.84-7.72 (d, 2H), 7.31-7.28 (d, 2H), 6.85 (s, 1H), 5.34 (s, 2H), 5.14-5.11 (t, 1H), 4.30-4.28 (d, 2H), 3.35 (s, 1H).  
15

Step 4: Preparation of 1-(4-cyanobenzyl)-5-chloromethyl imidazole HCl salt

20 Method 1: 1-(4-Cyanobenzyl)-5-hydroxymethylimidazole (1.0 kg), prepared as described above in Step 3, was slurried with DMF (4.8 L) at 22°C and then cooled to -5°C. Thionyl chloride (390 mL) was added dropwise over 60 min during which time the reaction temperature rose to a maximum of 9°C. The solution became nearly homogeneous  
25 before the product began to precipitate from solution. The slurry was warmed to 26°C and aged for 1 h.

The slurry was then cooled to 5°C and 2-propanol (120 mL) was added dropwise, followed by the addition of ethyl acetate (4.8 L). The slurry was aged at 5°C for 1 h before the solids were isolated and washed  
30 with chilled ethyl acetate (3 x 1 L). The product was dried in vacuo at 40°C overnight to provide the above-titled compound.

<sup>1</sup>H NMR (250 MHz DMSO-d<sub>6</sub>): δ 9.44 (s, 1H), 7.89 (d, 2H, 8.3 Hz), 7.89 (s, 1H), 7.55 (d, 2H, 8.3 Hz), 5.70 (s, 2H), 4.93 (s, 2H). <sup>13</sup>C NMR (75.5 MHz DMSO-d<sub>6</sub>): δ<sub>c</sub> 139.7, 137.7, 132.7, 130.1, 128.8, 120.7, 118.4, 111.2, 48.9, 33.1.

Method 2: To an ice cold solution of dry acetonitrile (3.2 L, 15 L/Kg hydroxymethylimidazole) was added 99% oxalyl chloride (101 mL, 1.15 mol, 1.15 equiv.), followed by dry DMF (178 mL, 2.30 mol, 2.30 equiv.), at which time vigorous evolution of gas was observed. After stirring for about 5 to 10 min following the addition of DMF, solid hydroxymethylimidazole (213 g, 1.00 mol), prepared as described above in Step 3, was added gradually. After the addition, the internal temperature was allowed to warm to a temperature of about 23°C to about 25°C and stirred for about 1 to 3 hours. The mixture was filtered, then washed with dry acetonitrile (400 mL displacement wash, 550 mL slurry wash, and a 400 mL displacement wash). The solid was maintained under a N<sub>2</sub> atmosphere during the filtration and washing to prevent hydrolysis of the chloride by adventitious H<sub>2</sub>O. This yielded the crystalline form of the chloromethylimidazole hydrochloride.

<sup>1</sup>H NMR (250 MHz DMSO-d<sub>6</sub>): δ 9.44 (s, 1H), 7.89 (d, 2H, 8.3 Hz), 7.89 (s, 1H), 7.55 (d, 2H, 8.3 Hz), 5.70 (s, 2H), 4.93 (s, 2H). <sup>13</sup>C NMR (75.5 MHz DMSO-d<sub>6</sub>): δ<sub>c</sub> 139.7, 137.7, 132.7, 130.1, 128.8, 120.7, 118.4, 111.2, 48.9, 33.1.

Method 3: To an ice cold solution of dry DMF (178 mL, 2.30 mol, 2.30 equiv.) in dry acetonitrile (2.56 L, 12 L/Kg Hydroxymethylimidazole) was added oxalyl chloride (101 mL, 1.15 mol, 1.15 equiv.). The heterogeneous mixture in the reagent vessel was then transferred to a mixture of hydroxymethylimidazole (213 g, 1.00 mol), prepared as described in Step 3 above, in dry acetonitrile (1.7 L, 8 L/Kg hydroxymethylimidazole). Additional dry acetonitrile (1.1 - 2.3 L, 5 - 11 L/Kg hydroxymethylimidazole) was added to the remaining solid Vilsmeier reagent in the reagent vessel. This, now nearly homogenous, solution was transferred to the reaction vessel at T<sub>i</sub> ≤ +6°C. The reaction vessel temperature was warmed to a temperature of about 23°C to about 25°C and stirred for about 1 to 3 hours. The mixture was then cooled to 0°C and aged 1 h. The solid was filtered and washed with dry, ice cold acetonitrile (400 mL displacement wash, 550 mL slurry wash, and a 400 mL displacement wash). The solid was maintained under a N<sub>2</sub>

atmosphere during the filtration and washing to prevent hydrolysis of the chloride by adventitious H<sub>2</sub>O. This yielded the crystalline form of the chloromethylimidazole hydrochloride.

5

#### EXAMPLE 24B

##### Preparation Of 1-(4'-Cyanobenzyl) imidazol-5-ylmethyl piperazine

Step 1: Preparation of 1-(4'-Cyanobenzyl) imidazol-5-ylmethyl piperazine-4-carboxylic acid benzyl ester

10

To an acetonitrile solution of 1-(4'-cyanobenzyl)-5-chloromethylimidazole (7.45 mmol), prepared as described in Example 24A, Step 4, and diisopropylethyl amine (22.4 mmol) was added 1-benzyl 1-piperazine carboxylate (10.4mmol). This solution was stirred for 4.0 hours at 80°C. The product was isolated after silica column purification.

15 <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ 7.65 (d, 2H); 7.55 (s, 1H); 7.38 (m, 5H); 7.15 (d, 2H); 7.0 (s, 1H); 5.3 (s, 2H); 5.1 (s, 1H); 3.4 (m, 4H); 3.3 (s, 2H); 2.3 (m, 4H).

Step 2: Preparation of 1-(4'-Cyanobenzyl) imidazol-5-ylmethyl piperazine

20

The product from Step 1 (6.17 mmol) was dissolved in absolute ethanol followed by the introduction of 10% Pd/C catalyst then hydrogen under atmospheric pressure. The catalyst was removed via filtration through filter-aid and the product was isolated by removing the solvent under reduced pressure.

25

<sup>1</sup>H-NMR (CD<sub>3</sub>OD): δ 7.8 (s, 1H); 7.75 (d, 2H); 7.3 (d, 2H); 6.9 (s, 1H); 5.45 (s, 2H); 3.3 (m, 4H); 2.6 (s, 2H); 2.3 (m, 4H).

#### EXAMPLE 24C

##### Preparation of 1-[1-(4'-Cyanobenzyl) imidazol-5-ylmethyl] piperazine-4-(DL-2-hydroxy-2-(o-methoxyphenyl)) acetamide

30

Step 1: Preparation of 2-(DL-O-tert-butyl diphenylsilyl)-2-(2-methoxyphenyl)acetic acid

35

The title product was obtained by treating DL-2-methoxymandelic acid (0.20 g, 1.1 mmol) with tert-butyldiphenyl silyl

chloride (2.42 mmol) and imidazole (11 mmol) followed by selective hydrolysis as outlined in J. Chem. Soc., Perkin Trans I, 1985, 2361. For example, the silyl ester was selectively hydrolyzed by treatment with 10% aqueous  $K_2CO_3$  followed by acidification (pH 3) with 1M  $KHSO_4$ .

5  $^1H$ -NMR ( $CDCl_3$ ):  $\delta$  6.8-7.7 (m, 14H); 5.4 (s, 1H); 3.65 (s, 3H); 1.05 (s, 9H).

Step 2: Preparation of 1-[1-(4'-Cyanobenzyl) imidazol-5-ylmethyl] piperazine-4-(DL-2-hydroxy-2-(o-methoxyphenyl)) acetamide

A DMF solution of the product from Step 1 (0.346 g, 0.826 mmol), 1-(4'-cyanobenzyl) imidazol-5-ylmethyl piperazine (0.116 g, 0.413 mmol) (prepared as described in Example 24A, Step 2), HOBt (0.132 g, 0.87 mmol), EDC (0.173 g, 0.91 mmol) and NMM (1.24 mmol) was stirred for 18 hours at 25°C. The pure deprotected and protected products were obtained directly after preparative hplc separation and lyophilization.  
10 FAB-MS: calc: 445.5, found: 446.2.  $^1H$ -NMR ( $CD_3OD$ ):  $\delta$  8.2 (s, 1H); 7.7 (d, 2H); 7.3-7.4 (m, 4H); 6.95-7.1 (m, 3H); 5.7 (s, 1H); 5.5 (s, 2H); 3.85 (s, 3H); 3.5 (m, 1H); 3.0-3.3 (m, 5H); 2.35 (m, 1H); 2.15 (m, 2H); 1.75 (m, 1H).  
15

#### EXAMPLE 24D

20 Preparation of 1-[1-(4'-cyanobenzyl) imidazol-5-ylmethyl]-4-[1-(2,6-dimethylbenzyloxycarbonyl) piperazine bis trifluoroacetate salt

A solution of 250 mg (1.84 mmol) of 2,5-dimethylbenzyl alcohol and 409 mg (2.03 mmol) of p-nitrophenylchloroformate in 5 ml of 7:1 THF/acetonitrile under an argon atmosphere was treated with 164 ml (2.03 mmol) of pyridine, and the resulting suspension was stirred vigorously at room temp. for 18h. The reaction was concentrated in vacuo to give a clear oil. The oil was dissolved in a minimum of chloroform and was chromatographed over silica gel with 9:1 hexanes/ethyl acetate as eluant. Product fractions were combined and concentrated in vacuo to give the carbonate intermediate as an off-white solid.  
30 400 Mhz  $H^1$  NMR( $CDCl_3$ ):  $\delta$  2.44 (d, 6H), 5.44 (s, 2H), 7.09 (d, 2H), 7.20 (t, 1H), 7.40 (d, 2H), 8.29 (d, 2H).  
35

A solution of 219 mg (0.71 mmol) of the above prepared carbonate intermediate, 200 mg (0.71 mmol) of 1-(4'-Cyanobenzyl) imidazol-5-ylmethyl piperazine (prepared as described in Example 24B, Step 2) and 247 ml (1.42 mmol) of DIEA in 2 ml of methylene chloride was stirred at room temp. for 18h. The reaction was concentrated in vacuo to a yellow oil. The oil was purified by reversed phase preparatory LC, and the pure fractions combined and concentrated to remove volatiles. Lyophilization of the aqueous residue provided the bis trifluoroacetic acid salt of the desired product as an amorphous fluffy white powder.

FAB MS:  $M^+ = 444.2$ . 400 Mhz  $H^1$  NMR( $CDCl_3$ ):  $\delta$  2.39 (s, 6H), 2.65 (br s, 4H), 3.58 (br s, 4H), 3.67 (s, 2H), 5.22 (s, 2H), 5.57 (s, 2H), 7.04 (d, 2H), 7.18 (t, 1H), 7.26 (d, 2H), 7.54 (s, 1H), 7.72 (d, 2H), 8.80 (s, 1H).

#### 15 EXAMPLE 24E

Preparation of 1-[1-(4'-cyanobenzyl) imidazol-5-ylmethyl]-4-[1-(2-ethoxybenzyloxycarbonyl) piperazine]

In a manner identical to that described above in Example 24D, from 160 mg (0.53 mmol) of (2-ethoxybenzyl)-(4-nitrophenyl) carbonate (prepared as described above in Example 24D from p-nitrophenylchloroformate and 2-ethoxybenzyl alcohol) and 150 mg (0.53 mmol) of 1-(4'-Cyanobenzyl) imidazol-5-ylmethyl piperazine (prepared as described above in Example 24B, Step 2) was obtained the bis trifluoroacetic acid salt of the title compound as an amorphous fluffy white powder.

High Res. FAB MS:  $M^+$  theo. = 460.2343, obs. = 460.2364. 400 Mhz  $H^1$  NMR( $DMSO-d_6$ ):  $\delta$  1.36 (t, 3H), 2.39 (br s, 4H), 3.21 (br s, 2H + 4H), 3.56 (br s, 2H), 4.04 (q, 2H), 5.02 (s, 2H), 5.60 (s, 2H), 6.93 (t, 1H), 7.00 (d, 1H), 7.26 (t, 1H), 7.29 (d, 1H), 7.44 (d, 2H), 7.71 (s, 1H), 7.89 (d, 2H), 9.18 (s, 1H).

### EXAMPLE 25

**Preparation of [N-Ac-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-Dox  
(SEQ.ID.NO.: 35)**

5

**Step A:** [N-Ac-(4-trans-L-Hyp(Bzl))]-Ala-Ser(Bzl)Chg-Gln-Ser(Bzl)Leu-PAM Resin (3-1).

Starting with 0.5 mmol (0.67g) Boc-Leu-PAM resin, the protected peptide was synthesized on a 430A ABI peptide synthesizer.

10 The protocol used a 4 fold excess (2 mmol) of each of the following  
protected amino acids: Boc-Ser(Bzl), Boc-Gln, Boc-Chg, Boc-Ala,  
N-Boc-(4-trans-L-Hyp(Bzl)). Coupling was achieved using DCC and  
HOBT activation in methyl-2-pyrrolidinone. Acetic acid was used for the  
introduction of the N terminal acetyl group. Removal of the Boc group  
15 was performed using 50% TFA in methylene chloride and the TFA salt  
neutralized with diisopropylethylamine. At the completion of the  
synthesis the peptide resin was dried to yield Intermediate 3-1.

Step B:        [N-Ac-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-OH  
                  (3-2)

5        The protected peptide resin (3-1), 1.2 g, was treated with HF (20 ml) for 1 hr at 0°C in the presence of anisole (2 ml). After evaporation of the HF, the residue was washed with ether, filtered and extracted with H<sub>2</sub>O (200 ml). The filtrate was lyophilized to yield Intermediate 3-2.

Step C:        [N-Ac-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-Dox

10        The above described intermediate (3-2), 1.157 g (1.45 mmol) was dissolved in DMSO (30 ml) and diluted with DMF (30 ml). To the solution was added doxorubicin hydrochloride, 516 mg (0.89 mmol) followed by 0.310 ml of diisopropylethylamine (1.78 mmol). The stirred solution was cooled (0°C) and 0.276 ml of diphenylphosphoryl azide (1.28 mmol) added. After 30 minutes, an additional 0.276 ml (1.28 mmol) of  
15        DPPA was added and the pH adjusted to ~7.5 (pH paper) with diisopropylethylamine (DIEA). The pH of the cooled reaction (0°C) was maintained at ~7.5 with DIEA for the next 3 hrs. and the reaction stirred at 0-4°C overnight. After 18 hrs., the reaction (found to be complete by analytical HPLC, system A) was concentrated to an oil. Purification of  
20        the crude product was achieved by preparative HPLC, Buffer A = 0.1% NH<sub>4</sub>OAc-H<sub>2</sub>O; B=CH<sub>3</sub>CN. The crude product was dissolved in 400 ml of 100% A buffer, filtered and purified on a C-18 reverse phase HPLC radial compression column (Waters, Delta-Pak, 15µM, 100Å). A step gradient of 100% A to 60% A was used at a flow rate of 75 ml/min (UV = 214nm).  
25        Homogeneous product fractions (evaluated by HPLC, system A) were pooled and freeze-dried. The product was dissolved in H<sub>2</sub>O (300 ml), filtered and freeze-dried to provide the purified title compound.

#### PHYSICAL PROPERTIES

30

The physical/chemical properties of the product of Step C are shown below:

35        Molecular Formula:                C<sub>62</sub>H<sub>85</sub>N<sub>9</sub>O<sub>23</sub>  
             Molecular Weight:            1323.6

**EXAMPLE 26**

Preparation of [N-Glutaryl-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-Dox (SEQ.ID.NO.: 60) (Compound B)

5

**Step A:** [N-Glutaryl(OFm)-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-PAM Resin

- Starting with 0.5mmol (0.67g) Boc-Leu-PAM resin, the protected peptide was synthesized on a 430A ABI peptide synthesizer.
- 10 The protocol used a 4 fold excess (2 mmol) of each of the following protected amino acids: Fmoc-Ser(tBu), Fmoc-Gln(Trt), Fmoc-Chg, Fmoc-Ala, Boc-(4-trans-L-Hyp). Coupling was achieved using DCC and HOBT activation in methyl-2-pyrrolidinone. The intermediate mono fluorenylmethyl ester of glutaric acid [Glutaryl(OFm)] was used for the
- 15 introduction of the N-terminal glutaryl group. Removal of the Fmoc group was performed using 20% piperidine. The acid sensitive protecting groups, Boc, Trt and tBu, were removed with 50% TFA in methylene chloride. Neutralization of the TFA salt was with

diisopropylethylamine. At the completion of the synthesis, the peptide resin was dried to yield the title compound.

5      Step B:      [N-Glutaryl(OFm)-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-OH

10              The protected peptide resin from Step A, 1.2 g, was treated with HF (20 ml) for 1 hr at 0°C in the presence of anisole (2 ml). After evaporation of the HF, the residue was washed with ether, filtered and extracted with DMF. The DMF filtrate (75 ml) was concentrated to dryness and triturated with H<sub>2</sub>O. The insoluble product was filtered and dried to provide the title compound.

15      Step C:      [N-Glutaryl(OFm)-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-Dox

20              The above prepared intermediate from Step B, (1.33g, 1.27mmol) was dissolved in DMSO (6 ml) and DMF (69 ml). To the solution was added doxorubicin hydrochloride, 599 mg (1.03 mmol) followed by 376µl of diisopropylethylamine (2.16 mmol). The stirred solution was cooled (0°C) and 324 µl of diphenylphosphoryl azide (1.5mmol) added. After 30 minutes, an additional 324 µl of DPPA was added and the pH adjusted to ~7.5 (pH paper) with diisopropylethylamine (DIEA). The pH of the cooled reaction (0°C) was maintained at ~7.5 with DIEA for the next 3 hrs and the reaction stirred at 0-4°C overnight. After 18 hrs., the reaction (found to be complete by analytical HPLC, system A) was concentrated to provide the title compound as an oil.

25      Step D:      [N-Glutaryl-(4-trans-L-Hyp)]-Ala-Ser-Chg-Gln-Ser-Leu-Dox

30              The above product from Step C was dissolved in DMF (54 ml), cooled (0°C) and 14 ml of piperidine added. The solution was concentrated to dryness and purified by preparative HPLC. (A=0.1% NH<sub>4</sub>OAc-H<sub>2</sub>O; B=CH<sub>3</sub>CN.) The crude product was dissolved in 100 ml of 80% A buffer, filtered and purified on a C-18 reverse phase HPLC radial compression column (Waters, Delta-Pak, 15µ, 100Å). A step gradient of 80% A to 67% A was used at a flow rate of 75 ml/min (uv = 214nm).

Homogeneous product fractions (evaluated by HPLC, system A) were pooled and freeze-dried. The product was further purified using the above HPLC column. Buffer A = 15% acetic acid-H<sub>2</sub>O; B=15% acetic acid-methanol. The product was dissolved in 100 ml of 20% B/80% A buffer and purified. A step gradient of 20% B to 80% B was used at a flow rate of 75 ml/min (uv = 260nm). Homogeneous product fractions (evaluated by HPLC, system A) were pooled, concentrated and freeze-dried from H<sub>2</sub>O to yield the purified title compound.

10 High Resolution ES Mass Spec: 1418.78 (Na<sup>+</sup>)

HPLC: System A

Column: Vydac 15 cm #218TP5415, C18

Eluant: Gradient 95:5 (A:B) to 5:95 (A:B) over 45 min.  
A=0.1% TFA/H<sub>2</sub>O, B=0.1% TFA/Acetonitrile

15 Flow: 1.5 ml/min.

Wavelength: 214 nm, 254 nm

Retention Time: 18.3 min.

**EXAMPLE 27**

Preparation of (4-trans-L-Hyp)-Ala-Ser-Chg-Gln-Ser-Leu-Dox  
(SEQ.ID.NO.: 61)

5

**Step A:** Fmoc-(4-trans-L-Hyp(Bzl))-Ala-Ser(Bzl)Chg-Gln-Ser(Bzl)Leu-PAM Resin

- Starting with 0.5 mmol (0.67g) Boc-Leu-PAM resin, the protected peptide was synthesized on a 430A ABI peptide synthesizer.
- 10 The protocol used a 4 fold excess (2 mmol) of each of the following protected amino acids: Boc-Ser(Bzl), Boc-Gln, Boc-Chg, Boc-Ala, N-Boc-(4-trans-L-Hyp(Bzl)). Coupling was achieved using DCC and HOBT activation in methyl-2-pyrrolidinone. Fmoc-OSu (succinamidyl ester of Fmoc) was used for the introduction of the N-terminal protecting group.
- 15 Removal of the Boc group was performed using 50% TFA in methylene chloride and the TFA salt neutralized with diisopropylethylamine. At the completion of the synthesis the peptide resin was dried to yield the title intermediate.

Step B: Fmoc-(4-trans-L-Hyp)-Ala-Ser-Chg-Gln-Ser-Leu-OH

The protected peptide resin from Step A, 1.1 g, was treated with HF (20 ml) for 1 hr at 0°C in the presence of anisole (2 ml). After  
5 evaporation of the HF, the residue was washed with ether, filtered and extracted with H<sub>2</sub>O (200 ml). The filtrate was lyophilized to yield the title intermediate.

Step C: Fmoc-(4-trans-L-Hyp)-Ala-Ser-Chg-Gln-Ser-Leu-Dox

10 The intermediate from Step B, 0.274 g, was dissolved in DMSO (10 ml) and diluted with DMF (10 ml). To the solution was added doxorubicin hydrochloride, 104 mg followed by 62 µL of diisopropylethylamine (DIEA). The stirred solution was cooled (0°C) and  
15 56 µL of diphenylphosphoryl azide added. After 30 minutes, an additional 56 µL of DPPA was added and the pH adjusted to ~7.5 (pH paper) with DIEA. The pH of the cooled reaction (0°C) was maintained at ~7.5 with DIEA. After 4 hrs., the reaction (found to be complete by analytical HPLC, system A) was concentrated to an oil. HPLC  
20 conditions, system A.

Step D: (4-trans-L-Hyp)-Ala-Ser-Chg-Gln-Ser-Leu-Dox

The above product from Step C was dissolved in DMF (10 ml), cooled (0°C) and 4 ml of piperidine added. The solution was concentrated to dryness and purified by preparative HPLC. (A=0.1% NH<sub>4</sub>OAc-H<sub>2</sub>O; B=CH<sub>3</sub>CN.) The crude product was dissolved in 100 ml of  
25 90% A buffer, filtered and purified on a C-18 reverse phase HPLC radial compression column (Waters, Delta-Pak, 15µ, 100Å). A step gradient of 90% A to 65% A was used at a flow rate of 75 ml/min (uv = 214nm). Homogeneous product fractions (evaluated by HPLC, system A) were  
30 pooled and freeze-dried.

#### EXAMPLE 28

*des*-Acetylvinblastine-4-O-(N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Ser-Pro) ester (SEQ.ID.: 49)

---

#### Step A: Preparation of 4-*des*- Acetylvinblastine

25 A sample of 2.40 g (2.63 mmol) of vinblastine sulfate (Sigma V-1377) was dissolved under N<sub>2</sub> in 135 ml of absolute methanol and treated with 45 ml of anhydrous hydrazine, and the solution was stirred at 20-25°C for 18 hr. The reaction was evaporated to a thick paste, which was partitioned between 300 ml of CH<sub>2</sub>Cl<sub>2</sub> and 150 ml of saturated  
 30 NaHCO<sub>3</sub>. The aqueous layer was washed with 2 100-ml portions of CH<sub>2</sub>Cl<sub>2</sub>, and each of the 3 CH<sub>2</sub>Cl<sub>2</sub> layers in turn was washed with 100 ml each of H<sub>2</sub>O (2X) and saturated NaCl (1X). The combined organic layers were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and the solvent was removed at reduced pressure to yield the title compound as an off-white  
 35 crystalline solid. This material was stored at -20°C until use.

Step B: Preparation of 4-des- Acetylvinblastine 4-O-(Prolyl) ester

A sample of 804 mg (1.047 mmol) of 4-des- acetylvinblastine, dissolved in 3 ml of CH<sub>2</sub>Cl<sub>2</sub> and 18 ml of anhydrous pyridine under nitrogen, was treated with 1.39 g of Fmoc-proline acid chloride (Fmoc-Pro-Cl, Advanced Chemtech), and the mixture was stirred for 20 hr at 25°C. When analysis by HPLC revealed the presence of unreacted starting des- acetylvinblastine, another 0.50 g of Fmoc-Pro-Cl was added, with stirring another 20 hr to complete the reaction. Water (ca. 3 ml) was added to react with the excess acid chloride, and the solution was then evaporated to dryness and partitioned between 300 ml of EtOAc and 150 ml of saturated NaHCO<sub>3</sub>, followed by washing twice with saturated NaCl. After drying (Na<sub>2</sub>SO<sub>4</sub>), the solvent was removed under reduced pressure to give an orange-brown residue, to which was added 30 ml of DMF and 14 ml of piperidine, and after 5 min the solution was evaporated under reduced pressure to give a orange-yellow semi-solid residue. After drying *in vacuo* for about 1 hr, approx. 200 ml of H<sub>2</sub>O and 100 ml of ether was added to this material, followed by glacial HOAc dropwise with shaking and sonication until complete dissolution had occurred and the aqueous layer had attained a stable pH of 4.5-5.0 (moistened pH range 4-6 paper). The aqueous layer was then washed with 1 100-ml portion of ether, and each ether layer was washed in turn with 50 ml of H<sub>2</sub>O. The combined aqueous layers were subjected to preparative HPLC in 2 portions on a Waters C4 Delta-Pak column 15µM 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), gradient elution 95 --> 70% A/ 70 min. Pooled fractions yielded, upon concentration and lyophilization, the title compound.

Step C: N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Ser-WANG Resin

Starting with 0.5 mmole (0.61 g) of Fmoc-Ser(t-Bu)-WANG resin loaded at 0.82 mmol/g, the protected peptide was synthesized on a ABI model 430A peptide synthesizer adapted for Fmoc/t-butyl-based synthesis. The protocol used a 2-fold excess (1.0 mmol) of each of the following protected amino acids: Fmoc-Ser(t-Bu)-OH, Fmoc-Gln-OH,

Fmoc-Chg-OH, Fmoc-4-trans-L-Hyp-OH; and acetic acid (double coupling). During each coupling cycle Fmoc protection was removed using 20% piperidine in N-methyl-2-pyrrolidinone (NMP), followed by washing with NMP. Coupling was achieved using DCC and HOBT  
 5 activation in NMP. At the completion of the synthesis, the peptide resin was dried to yield the title compound.

Step D: N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Ser- OH

One 0.5-mmol run of the above peptide-resin was suspended  
 10 in 25 ml of TFA, followed by addition of 0.625 ml each of H<sub>2</sub>O and triisopropylsilane, then stirring at 25° for 2.0 hr. The cleavage mixture was filtered, the solids were washed with TFA, the solvents were removed from the filtrate under reduced pressure, and the residue was trituated with ether to give a pale yellow solid, which was isolated by  
 15 filtration and drying in vacuo to afford the title compound.

High Resolution ES/FT-MS: 789.3

25 Step E: des- Acetylvinblastine-4-O-(N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Ser-Pro) ester

Samples of 522 mg (0.66 mmol) of the peptide prepared as described in step D and 555 mg (ca. 0.6 mmol) of 4-des- Acetylvinblastine 4-O-(Prolyl) ester from Step B, prepared as above, were dissolved in 17 ml  
 30 of DMF under N<sub>2</sub>. Then 163 mg (1.13 mmol) of 1-hydroxy-7-azabenzotriazole (HOAt) was added, and the pH was adjusted to 6.5-7 (moistened 5-10 range pH paper) with 2,4,6-collidine, followed by cooling to 0°C and addition of 155 mg (0.81 mmol) of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC). Stirring was continued at 0-  
 35 5°C until completion of the coupling as monitored by analytical HPLC (A

= 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), maintaining the pH at 6.5-7 by periodic addition of 2,4,6-collidine. After 12 hr the reaction was worked up by addition of ~4 ml of H<sub>2</sub>O and, after stirring 1 hr, concentrated to a small volume *in vacuo* and dissolution in *ca.* 150 ml of 5% HOAc. and preparative HPLC in two portions on a Waters C18 Delta-Pak column 15µM 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN, gradient elution 95 --> 65% A / 70 min). Homogeneous fractions containing the later-eluting product (evaluated by HPLC, system A, 95 --> 65% A / 30 min) from both runs were pooled and concentrated to a volume of ~50 ml and passed through approx. 40 ml of AG4X4 ion exchange resin (acetate cycle), followed by freeze-drying to give the title compound as a lyophilized powder.

High Resolution ES/FT-MS: 1637.0

#### EXAMPLE 29

*des*-Acetylvinblastine-4-O-(N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Ser-Pro) ester acetate (SEQ.ID.NO.: 49)

A sample of 4.50 g (3.7 mmol) of 4-O-(prolyl) *des*-acetylvinblastine TFA salt, prepared as described in Example 28, Step B, was dissolved in 300 ml of DMF under N<sub>2</sub>, and the solution was cooled to 0°. Then 1.72 g (10.5 mmol) of 3,4-dihydro-3-hydroxy-4-oxo-1,2,3-benzotriazine (ODHBT) was added, and the pH was adjusted to 7.0 (moistened 5-10 range pH paper) with N-methylmorpholine (NMM), followed by the addition of 4.95 g (5.23 mmol) of the N-acetyl-heptapeptide of Example 28, Step D, portionwise allowing complete dissolution between each addition. The pH was again adjusted to 7.0 with NMM, and 1.88 g (9.8 mmol) of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) was added, followed by stirring of the solution at 0-5°C until completion of the coupling as monitored by analytical HPLC (system A), maintaining the pH at *ca.* 7 by periodic addition of NMM. The analysis showed the major component at 26.3 min retention time preceded by a minor component (*ca.* 10 %) at 26.1 min, identified as the

D-Ser isomer of the title compound. After 20 hr the reaction was worked up by addition of 30 ml of H<sub>2</sub>O and, after stirring 1 hr, concentrated to a small volume *in vacuo* and dissolution in *ca.* 500 ml of 20% HOAc. and preparative HPLC in 12 portions on a Waters C18 Delta-Pak column  
5 15mM 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), gradient elution 85 --> 65% A / 90 min) at a flow rate of 80 ml/min.

Homogeneous fractions (evaluated by HPLC, system C) representing approx. one-fourth of the total run were pooled and concentrated to a volume of ~150 ml and passed through approx. 200 ml  
10 of *Bio-Rad* AG4X4 ion exchange resin (acetate cycle), followed by freeze-drying of the eluant gave the acetate salt of the title compound as a lyophilized powder: retention time (system A) 26.7 min, 98.9% pure; high resolution ES/FT-MS *m/e* 1636.82; amino acid compositional analysis 20 hr, 100°C, 6N HCl (theory/found), Ser4/3.91 (corrected), Glu  
15 1/0.92 (Gln converted to Glu), Chg 1/1.11, Hyp 1/1.07, Pro 1/0.99, peptide content 0.516 mmol/mg.

Further combination of homogeneous fractions and purification from side fractions, processing as above through approx. 500 ml of ion exchange resin, afforded an additional amounts of the title  
20 compound.

### EXAMPLE 30

Preparation of 4-*des*- Acetylvinblastine-23-(4'-aminomethylbicyclo-[2.2.2]octane) methylamide (BDAM-(dAc)vinblastine)

---

5    Step A            Preparation of 4-*des*- Acetylvinblastine-23-hydrazide

A sample of 3.99 g (4.38 mmol) of vinblastine sulfate (Sigma V-1377) was dissolved in 30.4 ml of 1:1 (v/v) absolute ethanol / anhydrous hydrazine, under N<sub>2</sub>, and the solution was heated in an oil bath at 60-65°C for 23 hr. Upon cooling, the solution was  
10 evaporated to a thick paste, which was partitioned between 300ml of CH<sub>2</sub>Cl<sub>2</sub> and 150 ml of saturated NaHCO<sub>3</sub>. The aqueous layer was washed with 2 100-ml portions of CH<sub>2</sub>Cl<sub>2</sub>, and each of the 3 CH<sub>2</sub>Cl<sub>2</sub> layers in turn was washed with 100 ml each of H<sub>2</sub>O (2X) and  
15 saturated NaCl (1X). The combined organic layers were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and the solvent was removed *in vacuo* to yield, after drying 20 hr *in vacuo*, the title compound as a white crystalline solid. This material was dissolved in 82 ml of dry, degassed DMF for storage at -20°C until use (conc. 36 mg/ml).

20    Step B            Boc-4-aminomethylbicyclo-[2.2.2]octane carboxylic acid

A sample of 8.79 g (40.0 mmol) of 4-carboxybicyclo-[2.2.2]octanemethylamine hydrochloride salt suspended in 100 ml each of THF and H<sub>2</sub>O was treated with 20.0 ml (14.6 g = 3.3 equiv.) of TEA, followed by 11.8 g (47.9 mmol) of BOC-ON reagent. All went into  
25 solution, and after stirring 24 hr the solution was concentrated *in vacuo* to a volume of about 50 ml and partitioned between 100 ml of ether and 300 ml of H<sub>2</sub>O. After addition of about 2 ml of TEA the aqueous layer was washed with ether (3X), each ether in turn washed with H<sub>2</sub>O, and the combined aqueous layer was acidified  
30 with 5% KHSO<sub>4</sub> to give the title compound as a white solid, isolated by filtration and drying *in vacuo*.

Step C      Boc-4-aminomethylbicyclo-[2.2.2]octane carboxamide

A stirred solution under N<sub>2</sub> of 12.0 g (42.5 mmol) of the product from step B in 100 ml of DMF was treated with 8.0 g (49.3 mmol) of carbonyldiimidazole. After 30 min the DMF was evaporated  
5 *in vacuo* to afford 50-60 ml of a light brown paste, which was stirred and treated with 70 ml of conc. NH<sub>4</sub>OH rapidly added. The initial solution turned to a white paste within 30 min, after which H<sub>2</sub>O was added up to a total volume of 400 ml to complete precipitation of product, which was triturated and isolated by filtration and washing  
10 with H<sub>2</sub>O, and dried *in vacuo* to yield the title compound as a white solid.

Step D      Boc-4-aminomethylbicyclo-[2.2.2]octane nitrile

A solution of 7.52 g (26.6 mmol) of the product from step  
15 C in 50 ml of CH<sub>2</sub>Cl<sub>2</sub> and 80 ml of anhydrous pyridine was treated with 11.12 g of (methoxycarbonylsulfamoyl)-triethyl-ammonium hydroxide inner salt (Burgess reagent) in 1-g portions over 5 min. After stirring for 1.5 hr, TLC (90-10-1, CHCl<sub>3</sub>-CH<sub>3</sub>OH-H<sub>2</sub>O) showed complete conversion to product, and the solution was evaporated to  
20 give a paste, to which H<sub>2</sub>O was added, up to 400 ml, with trituration and stirring to afford, after standing 20 hr at 0°C, filtration and drying *in vacuo*, the title compound as a white solid.

Step E      Boc-4-aminomethylbicyclo-[2.2.2]octane methylamine

A solution of 6.75 g (25.5 mmol) of the product from step  
25 D in 200 ml of CH<sub>3</sub>OH plus 4 ml of HOAc and 2 ml of H<sub>2</sub>O was hydrogenated over 1.63 g of PtO<sub>2</sub> in a Parr shaker at 55 psi for 22 hr. The catalyst was removed by filtration through Celite, and the filtrate was concentrated *in vacuo* to an oily residue, which was  
30 flushed/evaporated with CH<sub>3</sub>OH (1X) and CH<sub>2</sub>Cl<sub>2</sub> (2X). Product began to crystallize toward the end of the evaporation, and ether (up to 300 ml) was added to complete the precipitation. The white solid was triturated and isolated by filtration and washing with ether to give, after drying *in vacuo*, the title compound as the acetate salt.  
35 400 Mhz <sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ (ppm, TMS) 4.5 (1s, Boc-NH);

2.9 (2br d, -CH<sub>2</sub>-NH-Boc); 2.45 (2br s, -CH<sub>2</sub>-NH<sub>2</sub>);  
2.03 (3s, CH<sub>3</sub>COOH); 1.45 (9s, Boc); 1.40 (12s, ring CH<sub>2</sub>).

Step F Preparation of 4-*des*- Acetylvinblastine-23-(4'-aminomethylbicyclo-[2.2.2]octane) methylamide (BDAM-(dAc)vinblastine)

A 30-ml aliquot of the above DMF solution of 4-*des*-acetylvinblastine-23-hydrazide (1.41 mmol), cooled to -15°C under Argon, was converted to the azide *in situ* by acidification with 4M HCl in dioxane to pH < 1.5 (moistened 0-2.5 range paper), followed by addition of 0.27 ml (1.3 equiv) of isoamyl nitrite and stirring for 1 hr at 10-15°C. The pH was brought to 7 by the addition of DIEA, and a slurry of 1.27 g (3.8 mmol) of the Boc diamine product from step E above in 20 ml of DMF was then added, and the reaction was allowed to warm slowly to 15-20°C over 2 hr, at which point coupling was complete, as monitored by analytical HPLC (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN). The solvent was removed *in vacuo* and the residue partitioned between EtOAc and 5% NaHCO<sub>3</sub>, the organic layer washed with 5% NaCl, and the aqueous layers back-extracted with CH<sub>2</sub>Cl<sub>2</sub> to assure removal of the intermediary Boc-BDAM-(dAc)vinblastine. The combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub>, the solvent was removed under reduced pressure, and the residue, after flush/evaporation twice from CH<sub>2</sub>Cl<sub>2</sub>, was dissolved in 30 ml of CH<sub>2</sub>Cl<sub>2</sub> and treated with 30 ml of TFA for 30 min. The solvents were rapidly removed *in vacuo*, and the residue was dissolved in 300 ml of 10% HOAc for purification by preparative HPLC in 5 portions on a Waters C4 Delta-Pak column 15μM 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), gradient elution 95 --> 70% A / 60 min, isocratic 70% / 20 min. Homogeneous fractions (evaluated by HPLC, system A, 95 --> 50% A) from the five runs were pooled and concentrated *in vacuo*, followed by freeze-drying to give of the title compound as the lyophilized TFA salt.

HPLC conditions, system A:

### EXAMPLE 31

Preparation of 4-des- Acetylvinblastine-23-(N-Acetyl-Ser-Ser-Ser-  
Chg-Gln-Ser-Val-BDAM) amide acetate salt (SEQ.ID.NO.: 45)

15

Step A:      N-Acetyl-Ser-Ser-Ser-Chg-Gln-Ser-Val-PAM Resin  
(SEQ.ID.NO.: 45)

---

Starting with 0.5 mmole (0.68 g) of Boc-Val-PAM resin, the protected peptide was synthesized on a ABI model 430A peptide synthesizer. The protocol used a 4-fold excess (2.0 mmol) of each of the following protected amino acids: Boc-Ser(Bzl)-OH, Boc-Gln-OH, Boc-Chg-OH; and acetic acid (2 couplings). During each coupling cycle Boc protection was removed using TFA, followed by neutralization with DIEA. Coupling was achieved using DCC and HOBt activation in N-methyl-2-pyrrolidinone. At the completion of the synthesis, the peptide resin was dried to yield the title compound.

Step B:      N-Acetyl-Ser-Ser-Ser-Chg-Gln-Ser-Val-OH  
(SEQ.ID.NO.: 45)

---

Three 0.5-mmol runs of the above peptide-resin (3.5 g) were combined and treated with liquid HF (65 ml) for 1.5 hr at 0°C in the presence of anisole (6 ml). After evaporation of the HF, the residue was washed with ether, filtered and leached with 150 ml of DMF in several portions, adding DIEA to pH ~8, followed by removal of the DMF *in vacuo* to a volume of 100 ml. The concentration was determined as *ca.* 11.7 mg/ml ( by weighing the dried resin before and after leaching. The sample purity was determined as 96% by HPLC. The solution was used directly for conjugation with BDAM-(dAc)vinblastine.

Step C:      4-Des- acetylvinblastine-23-( N-Acetyl-Ser-Ser-Ser-Chg-Gln-Ser-Val-BDAM) amide acetate salt (SEQ.ID.NO.: 45)

---

To 58 ml (equivalent to 0.875 mmol of peptide) of the solution from step B was added 530 mg (0.520 mmol) of BDAM-(dAc)vinblastine, prepared as described in Example 30, Step F, under N<sub>2</sub>, cooling to 0°C, and the pH was adjusted to ~8 (moistened 5-10 range pH paper) with DIEA. Then 0.134 ml (0.62 mmol) of DPPA was added, followed by stirring at 0-5°C until completion of the coupling as monitored by analytical HPLC (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1%

- TFA/CH<sub>3</sub>CN), maintaining the pH at  $\geq 7$  by periodic addition of DIEA. After 24 hr, the reaction was worked up by addition of 10 ml of H<sub>2</sub>O, stirring 1 hr and concentration to small volume *in vacuo*, then dissolution in *ca.* 100 ml of 10% HOAc/5% CH<sub>3</sub>CN, adjustment of the
- 5 pH to 5 with NH<sub>4</sub>HCO<sub>3</sub>, filtration to remove insolubles, and preparative HPLC in 3 portions on a Waters C4 Delta-Pak column 15 $\mu$ M 300A (A = 0.1% NH<sub>4</sub>HCO<sub>3</sub>/H<sub>2</sub>O; B = CH<sub>3</sub>CN), gradient elution 95 --> 40% A / 70 min. Fractions from each run containing product were pooled, acidified to pH 3 with glacial HOAc, concentrated *in*
- 10 *vacuo* to a volume of ~50 ml, and purified by preparative HPLC on a Waters C18 Delta-Pak column 15 $\mu$ M 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), gradient elution 95 --> 70% A / 60 min, isocratic 70% / 20 min. Homogeneous fractions (evaluated by HPLC, system A, 95 --> 50% A) from all three runs were pooled and concentrated to a
- 15 volume of ~100 ml., diluted with 5% CH<sub>3</sub>CN, and passed through AG4X4 ion exchange resin (acetate cycle), followed by freeze-drying to give the title compound as a lyophilized powder.

### EXAMPLE 32

10 Preparation of 4-*des*- Acetylvinblastine-23-(N-methoxy-diethylene-  
oxyacetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Val-BDAM) amide  
acetate salt (SEQ.ID.NO.: 46)

Step A:      N-methoxydiethyleneoxyacetyl-4-trans-L-Hyp-Ser-Ser-Chg-  
Gln-Ser-Val-PAM Resin (SEQ.ID.NO.: 46)

Starting with 0.5 mmole (0.68 g) of Boc-Val-PAM resin,  
the protected peptide was synthesized on a ABI model 430A peptide  
5 synthesizer. The protocol used a 4-fold excess (2.0 mmol) of each of  
the following protected amino acids: Boc-Ser(Bzl)-OH, Boc-Gln-OH,  
Boc-Chg-OH, Boc-4-trans-Hyp(Bzl)-OH; and 2-[2-(2-methoxyethoxy)-  
ethoxy]acetic acid (2 couplings). During each coupling cycle Boc  
protection was removed using TFA, followed by neutralization with  
10 DIEA. Coupling was achieved using DCC and HOBT activation in N-  
methyl-2-pyrrolidinone. At the completion of the synthesis, the  
peptide resin was dried to yield the title compound.

Step B:      N-methoxydiethyleneoxyacetyl-4-trans-L-Hyp-Ser-Ser-Chg-  
15 Gln-Ser-Val-OH (SEQ.ID.NO.: 46)

Two 0.5-mmol runs of the above peptide-resin (2.4 g)  
were combined and treated with liquid HF (40 ml) for 1.5 hr at 0°C in  
the presence of anisole (4 ml). After evaporation of the HF, the  
residue was washed with ether, filtered and leached with 150 ml of  
20 H<sub>2</sub>O in several portions, followed by preparative HPLC on a Waters  
C18 Delta-Pak column 15µM 100A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1%  
TFA/CH<sub>3</sub>CN), gradient elution 95 --> 70% A / 70 min, and pooling of  
homogeneous fractions and freeze drying to give the title compound  
as lyophilized powder. The sample purity was determined as 99% by  
25 HPLC.

Step C:      4-des- Acetylvinblastine-23-(N-methoxydiethylene-oxyacetyl-  
4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-Val-BDAM) amide  
acetate salt (SEQ.ID.NO.: 46)

30 Samples of 440 mg (0.47 mmol) of the peptide from step B  
and 340 mg (0.33 mmol) of BDAM-(dAc)vinblastine, prepared as  
described in Example 30, Step F, were dissolved in 25 ml of DMF  
under N<sub>2</sub>, cooling to 0°C. Then 85 mg (0.63 mmol) of 1-hydroxy-7-  
azabenzotriazole (HOAt) was added, and the pH was adjusted to 6.5-7  
35 (moistened 5-10 range pH paper) with 2,4,6-collidine, followed by

addition of 117 mg (0.61 mmol) of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC). Stirring was continued at 0-5°C until completion of the coupling as monitored by analytical HPLC (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN), maintaining the pH at

- 5 6.5-7 by periodic addition of 2,4,6-collidine. After 3 hr the reaction was worked up by addition of ~10 ml of H<sub>2</sub>O, stirring 1 hr and concentration to small volume *in vacuo*, then dissolution in ca. 70 ml of 5% HOAc. and preparative HPLC on a Waters C18 Delta-Pak column 15µM 300A (A = 0.1% TFA/H<sub>2</sub>O; B = 0.1% TFA/CH<sub>3</sub>CN),  
10 gradient elution 95 --> 40% A / 70 min). Homogeneous fractions (evaluated by HPLC, system A, 95 --> 50% A) from all three runs were pooled and concentrated to a volume of ~50 ml and passed through AG4X4 ion exchange resin (acetate cycle), followed by freeze-drying to give the title compound as a lyophilized powder.

### EXAMPLE 33

- 5 Preparation of 4-des- Acetylvinblastine-23-(N-Acetyl-4-trans-L-Hyp-  
Ser-Ser-Chg-Gln-Ser-HCAP) amide acetate salt (2-7) (SEQ.ID.NO.:  
62)

- 10 Step A: N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-OH (2-1)  
(SEQ.ID.NO. 63)

- Starting with 0.5 mmole (0.80 g) of Fmoc-Gln(Trt)-Wang resin, the protected peptide was synthesized on a ABI model 430A peptide synthesizer. The protocol used a 4-fold excess (2.0 mmol) of each of the following protected amino acids: Fmoc-Ser(tBu)-OH, Fmoc-Chg-OH, Fmoc-4-trans-  
15 Hyp(tBu)-OH and acetic acid (2 couplings). During each coupling cycle Fmoc protection was removed using 20% piperidine in DMF. Coupling was achieved using DCC and HOBt activation in N-methyl-2-pyrrolidinone. At the completion of the synthesis, the peptide resin was dried. 1.3 g peptide-resin was treated with 95%TFA :2.5% H<sub>2</sub>O :2.5% Triisopropylsilane (20 ml)  
20 for 2 hr at r.t. under argon. After evaporation of the TFA, the residue was washed with ether, filtered and dried to give crude peptide which was purified by preparatory HPLC on a Delta-Pak C18 column with 0.1% trifluoroacetic acid -aqueous acetonitrile solvent systems using 100-70%A, 60min linear gradient. Fractions containing product of at least 99%  
25 (HPLC) purity were combined to give the title compound.

FABMS: 615.3

Peptide Content: 1.03nmole/mg.

- HPLC: 99% pure @214 nm, retention time= 10.16 min, (Vydac C18,  
gradient of 95%A/B to 50%A/B over 30 min, A=0.1%TFA-H<sub>2</sub>O,  
30 B=0.1%TFA-CH<sub>3</sub>CN)

In a similar manner the following compound was prepared:

N-hydroxyacetyl-Abu-Ser-Ser-Chg-Gln-Ser-OH (3-1) (SEQ.ID.NO. 64)

Step B: N-Boc-(1S,2R)-(+)-Norephedrine (2-2)

A solution of 1.51 g (10 mmol) of (1S,2R)-(+)-Norephedrine in a mixture of 1,4 dioxane (20 ml), water (10 ml) and 1N NaOH (10 ml) was stirred and cooled in an ice-water bath. Di-(t-butyl) dicarbonate (2.4 g, 11 mmol) was added in portions over approx. 20 min. The reaction was stirred in the cold for 2 hrs., then at room temp. for an additional 1h. The solution was concentrated to remove most of the dioxane, cooled in an ice bath and covered with a layer of ethyl acetate (30 ml) and acidified to pH 2 with 1N KHSO<sub>4</sub>. The aqueous phase was extracted 2x with EtOAc. The combined extracts were washed with water, brine and were concentrated and dried to provide the desired product as a white crystalline solid (2-2). FABMS: 252

Step C: N-Boc-HCAP (2-3)

A solution of 2.38 g of N-Boc-(1S,2R)-(+)-Norephedrine (2-2) in 50 ml acetic acid/10 ml H<sub>2</sub>O was hydrogenated at 60 psi on a Parr apparatus over 500 mg of Ir black catalyst for 24 hrs. The reaction was filtered through a Celite pad, and the filtrate concentrated *in vacuo* to give a tan foam (2-3). FABMS: 258.2

Step D: N-Benzoyloxycarbonyl-Ser-N-t-Boc-HCAP ester (2-4)

A solution of 1.95 g (6.6 mmol) of N-Z-Ser(tBu)-OH, 1.54g (6.0 mmol) of N-Boc-HCAP (2-3), 1.26 g (6.6 mmol) of EDC, and 146 mg (1.2 mmol) of DMAP in 30 ml of anh. CH<sub>2</sub>Cl<sub>2</sub> was treated and the resulting solution stirred at room temp. in an N<sub>2</sub> atmosphere for 12h. The solvent was removed in vacuo, the residue dissolved in ethyl acetate (150 ml) and the solution extracted with 0.5 N NaHCO<sub>3</sub> (50 ml), water (50 ml) and brine, then dried and concentrated to provide the crude coupling product (2-4).

In a similar manner the following compound was prepared:

N-Benzoyloxycarbonyl-Pro-N-t-Boc-HCAP ester (3-2)

by coupling of N-Z-Pro-OH with N-Boc-HCAP alcohol (2-3)

Step E: H-Ser(tBu)-N-t-Boc-HCAP ester (2-5)

A 2.0 g of (2-4) in a solution of 90 ml EtOH, 20ml water, and 10 ml acetic acid was hydrogenated on a Parr apparatus at 50 psi over 200 mg of Pd(OH)<sub>2</sub> catalyst for 3h. The reaction was filtered through a  
5 Celite pad, and the filtrate was concentrated to small volume *in vacuo*, then purified by preparatory HPLC on a Delta-Pak C18 column with 0.1% trifluoroacetic acid-aqueous acetonitrile solvent systems using 95-50%A, 60min linear gradient. Fractions containing product of at least 99% (HPLC) purity were combined to give the intermediate (2-5). FABMS:  
10 401.3

In a similar manner the following compound was prepared:

H-Pro-N-t-Boc-HCAP ester (3-3)

by hydrogenation of N-Benzyloxycarbonyl-Pro-N-t-Boc-HCAP  
15 ester (3-2)

Step F: N-Acetyl-4-trans-L-Hyp-Ser-Ser-Chg-Gln-Ser-HCAP amine (2-6) (SEQ.ID.NO. 62)

A solution of 614 mg (1.0 mmol) of N-Acetyl-4-trans-L  
20 Hyp-Ser-Ser-Chg-Gln-OH (2-1), 400 mg (1.0 mmol) of H-Ser(tBu)-N-t-Boc-HCAP ester (2-5), 229 mg (1.2 mmol) of EDC, and 81 mg (0.5 mmol) of ODBHT (3,4-dihydro-3-hydroxy-4-oxo-1,2,3-benzotriazine), in 7 ml of DMF was stirred at 0°C. in an N<sub>2</sub> atmosphere for 10 h. The solvent was removed *in vacuo*, the residue was washed with ether and dried. The  
25 crude product was treated with 95%TFA :5% H<sub>2</sub>O (20 ml) for 2 hr at r.t. under argon. After evaporation of the TFA, the residue was purified by preparatory HPLC on a Delta-Pak C18 column with 0.1% trifluoroacetic acid -aqueous acetonitrile solvent systems using 95-50%A, 60min linear gradient. Fractions containing product of at least 99% (HPLC) purity  
30 were combined to give the intermediate compound (2-6).

FABMS: 841.8

Peptide Content: 863.39 NMole/mg.

HPLC: 99% pure @214 nm, retention time= 13.7 min, (Vydac C18, gradient of 95%A/B to 5%A/B over 30 min, A=0.1%TFA-H<sub>2</sub>O,  
35 B=0.1%TFA-CH<sub>3</sub>CN)

In a similar manner the following compound was prepared:

N-Hydroxyacetyl-Abu-Ser-Ser-Chg-Gln-Ser-  
Pro-HCAP amine (3-4) (SEQ.ID.NO.65)

- 5 by coupling of N-Hydroxyacetyl-Abu-Ser-Ser-Chg-Gln-Ser-OH (3-1) with  
H-Pro-N-t-Boc-HCAP ester (3-3) followed by deprotection.

Step G: 4-des- Acetylvinblastine-23-(N-Ac-4-trans-L-Hyp-Ser-Ser-  
Chg-Gln-Ser-HCAP) amide acetate salt (2-7)

- 10 A solution of 0.461 of 4-des- acetylvinblastine-23-  
hydrazide (0.6 mmol) in 10 ml DMF cooled to -15°C under Argon, was  
converted to the azide *in situ* by acidification with 4M HCl in dioxane  
to pH < 1.5 (moistened 0-2.5 range paper), followed by addition of 0.105  
ml (1.3 equiv) of isoamyl nitrite and stirring for 1 hr at 10-15°C. The  
15 pH was brought to 7 by the addition of DIEA, and 555 mg (0.66 mmol)  
of amine derivative (2-6) from step F was then added, and the reaction  
was stirred at 0°C for 24 hrs, and purified by preparatory HPLC on a  
15µM,100A, Delta-Pak C18 column with 0.1% trifluoroacetic acid -  
aqueous acetonitrile solvent systems using 95-50%A, 60min linear  
20 gradient. Homogeneous fractions were pooled and concentrated *in*  
*vacuo*, followed by freeze-drying to give the title compound as the TFA  
salt which was converted to the corresponding HOAc salt by AG 4x4  
resin (100-200 mesh, free base form, BIO-RAD) (2-7).

5    Step B:        N-Boc-(1S,2R)-(+)-Norephedrine (2A-2)

A solution of 1.51 g (10 mmol) of (1S,2R)-(+)-Norephedrine in a mixture of 1,4 dioxane (20 ml), water (10 ml) and 1N NaOH (10 ml) is stirred and cooled in an ice-water bath. Di-(t-butyl) dicarbonate (2.4 g, 11 mmol) was added in portions over approx. 20 min. The reaction was  
10 stirred in the cold for 2hrs., then at room temp. for an additional 1h. The solution was concentrated to remove most of the dioxane, cooled in an ice bath and covered with a layer of ethyl acetate (30 ml) and acidified to pH 2 with 1N KHSO<sub>4</sub>. The aqueous phase was extracted 2x with  
15 EtOAc. The combined extracts were washed with water, brine and were concentrated and dried to provide the desired product as a white crystalline solid. FABMS: 252

Step C:        N-Boc-HCAP (2A-3)

A solution of 2.38 g of N-Boc-(1S,2R)-(+)-Norephedrine (2A-2)  
20 in 50 ml acetic acid/10 ml H<sub>2</sub>O was hydrogenated at 60 psi on a Parr apparatus over 500 mg of Ir black catalyst for 24 hrs. The reaction was filtered through a Celite pad, and the filtrate concentrated *in vacuo* to give a tan foam. FABMS: 258.2

25    Step D:        N-Benzoyloxycarbonyl-Pro-N-t-Boc-HCAP ester (2A-4)

A solution of 1.62 g (6.6 mmol) of N-Z-Pro-OH, 1.54g (6.0 mmol) of N-Boc-HCAP (2A-3), 1.26 g (6.6 mmol) of EDC, and 146 mg (1.2 mmol) of DMAP in 30 ml of anh. CH<sub>2</sub>Cl<sub>2</sub> was treated and the resulting solution stirred at room temp. in an N<sub>2</sub> atmosphere for 12h. The solvent  
30 was removed in vacuo, the residue dissolved in ethyl acetate (150 ml) and the solution extracted with 0.5 N NaHCO<sub>3</sub> (50 ml), water (50 ml) and brine, then dried and concentrated to provide the crude coupling product.

Step E: H-Pro-N-t-Boc-HCAP ester (2A-5)

A 2.0 g of (2A-4) in a solution of 90 ml EtOH, 20ml water, and 10 ml acetic acid was hydrogenated on a Parr apparatus at 50 psi over 200 mg of Pd(OH)<sub>2</sub> catalyst for 3h. The reaction was filtered  
5 through a Celite pad, and the filtrate was concentrated to small volume *in vacuo*, then purified by preparatory HPLC on a Delta-Pak C18 column with 0.1% trifluoroacetic acid -aqueous acetonitrile solvent systems using 95-50%A, 60min linear gradient. Fractions containing product of at least 99% (HPLC) purity were combined to give the title compound (2A-  
10 5). FABMS: 356.3

Step F: N-Acetyl -Ser-Chg-Gln-Ser-Ser-Pro-HCAP amine (2A-6)  
(SEQ.ID.NO.: 65)

A solution of 589 mg (1.0 mmol) of N-Acetyl-Ser-Chg-Gln-Ser-Ser-OH (2-1), 356 mg (1.0 mmol) of H-Pro-N-t-Boc-HCAP ester (2A-5),  
15 229 mg (1.2 mmol) of EDC, and 81 mg (0.5 mmol) of ODBHT (3,4-dihydro-3-hydroxy-4-oxo-1,2,3-benzotriazine), in 7 ml of DMF was stirred at 0°C. in an N<sub>2</sub> atmosphere for 10 h. The solvent was removed *in vacuo*, the residue was washed with ether and dried. The crude product was  
20 treated with 95%TFA :5% H<sub>2</sub>O (20 ml) for 2 hr at r.t. under argon. After evaporation of the TFA, the residue was purified by preparatory HPLC on a Delta-Pak C18 column with 0.1% trifluoroacetic acid -aqueous acetonitrile solvent systems using 95-50%A, 60min linear gradient. Fractions containing product of at least 99% (HPLC) purity were  
25 combined to give the title compound (2-6).

FABMS: 825.5

Peptide Content: 893.6 NMole/mg.

HPLC: 99% pure @214 nm, retention time= 15.2 min, (Vydac C18, gradient of 95%A/B to 5%A/B over 30 min, A=0.1%TFA-H<sub>2</sub>O,

30 B=0.1%TFA-CH<sub>3</sub>CN)

Step G: 4-des- Acetylvinblastine-23-(N-Ac -Ser-Chg-Gln-Ser-Ser-Pro-HCAP) amide acetate salt (2A-7) (SEQ.ID.NO.: 66)

A solution of 0.461 of 4-des- acetylvinblastine-23-  
35 hydrazide (0.6 mmol) in 10 ml DMF cooled to -15°C under Argon, was

converted to the azide *in situ* by acidification with 4M HCl in dioxane to pH < 1.5 (moistened 0-2.5 range paper), followed by addition of 0.105 ml (1.3 equiv) of isoamyl nitrite and stirring for 1 hr at 10-15°C. The pH was brought to 7 by the addition of DIEA, and 545 mg (0.66 mmol) of amine derivative (2A-6) from step F was then added, and the reaction was stirred at 0°C for 24 hrs, and purified by preparatory HPLC on a 15µM,100A, Delta-Pak C18 column with 0.1% trifluoroacetic acid-aqueous acetonitrile solvent systems using 95-50%A, 60min linear gradient. Homogeneous fractions were pooled and concentrated *in vacuo*, followed by freeze-drying to give the title compound as the TFA salt which was converted to title compound by AG 4x4 resin (100-200 mesh, free base form, BIO-RAD) (2A-7)

## 20 BIOLOGICAL ASSAYS.

The ability of the compounds useful in the methods of the present invention of the present invention to inhibit prenyl protein transferases can be demonstrated using the following assays.

## 25 EXAMPLE 35

### *In vitro* inhibition of ras farnesyl transferase

*Transferase Assays.* Isoprenyl-protein transferase activity assays are carried out at 30°C unless noted otherwise. A typical reaction contains (in a final volume of 50 µL): [<sup>3</sup>H]farnesyl diphosphate, Ras protein, 50 mM HEPES, pH 7.5, 5 mM MgCl<sub>2</sub>, 5 mM dithiothreitol, 10 µM ZnCl<sub>2</sub>, 0.1% polyethyleneglycol (PEG) (15,000-20,000 mw) and isoprenyl-protein transferase. The FPTase employed in the assay is prepared by recombinant expression as described in Omer, C.A., Kral, A.M., Diehl, R.E., Prendergast, G.C., Powers, S., Allen, C.M., Gibbs,

J.B. and Kohl, N.E. (1993) *Biochemistry* 32:5167-5176. After thermally pre-equilibrating the assay mixture in the absence of enzyme, reactions are initiated by the addition of isoprenyl-protein transferase and stopped at timed intervals (typically 15 min) by the addition of 1 M HCl in ethanol (1 mL). The quenched reactions are allowed to stand for 15 m (to complete the precipitation process). After adding 2 mL of 100% ethanol, the reactions are vacuum-filtered through Whatman GF/C filters. Filters are washed four times with 2 mL aliquots of 100% ethanol, mixed with scintillation fluid (10 mL) and then counted in a Beckman LS3801 scintillation counter.

For inhibition studies, assays are run as described above, except test compounds or compositions are prepared as concentrated solutions in 100% dimethyl sulfoxide and then diluted 20-fold into the enzyme assay mixture. Substrate concentrations for inhibitor IC<sub>50</sub> determinations are as follows: FTase, 650 nM Ras-CVLS (SEQ.ID.NO.: 1), 100 nM farnesyl diphosphate.

The compounds of the instant invention described in the above Examples 1-24E are tested for inhibitory activity against human FPTase by the assay described above.

### EXAMPLE 36

#### Modified *In vitro* GGTase inhibition assay

The modified geranylgeranyl-protein transferase inhibition assay is carried out at room temperature. A typical reaction contains (in a final volume of 50  $\mu$ L): [<sup>3</sup>H]geranylgeranyl diphosphate, biotinylated Ras peptide, 50 mM HEPES, pH 7.5, a modulating anion (for example 10 mM glycerophosphate or 5mM ATP), 5 mM MgCl<sub>2</sub>, 10  $\mu$ M ZnCl<sub>2</sub>, 0.1% PEG (15,000-20,000 mw), 2 mM dithiothreitol, and geranylgeranylprotein transferase type I (GGTase). The GGTase-type I enzyme employed in the assay is prepared as described in U.S. Pat. No. 5,470,832, incorporated by reference. The Ras peptide is derived from the K4B-Ras protein and has the following sequence: biotinyl-GKKKKKKSKTKCVIM (single amino acid code) (SEQ.ID.NO.:68). Reactions are initiated by the addition of GGTase and stopped at timed intervals (typically 15 min) by the addition

of 200  $\mu$ L of a 3 mg/mL suspension of streptavidin SPA beads (Scintillation Proximity Assay beads, Amersham) in 0.2 M sodium phosphate, pH 4, containing 50 mM EDTA, and 0.5% BSA. The quenched reactions are allowed to stand for 2 hours before analysis on a Packard TopCount scintillation counter.

For inhibition studies, assays are run as described above, except test compounds or compositions are prepared as concentrated solutions in 100% dimethyl sulfoxide and then diluted 25-fold into the enzyme assay mixture. IC<sub>50</sub> values are determined with Ras peptide near  $K_M$  concentrations. Enzyme and substrate concentrations for inhibitor IC<sub>50</sub> determinations are as follows: 75 pM GGTase-I, 1.6  $\mu$ M Ras peptide, 100 nM geranylgeranyl diphosphate.

The compounds of the instant invention described in the above Examples 1-24E are tested for inhibitory activity against human GGTase type I by the assay described above.

### EXAMPLE 37

#### Cell-based *in vitro* ras farnesylation assay

The cell line used in this assay is a v-ras line derived from either Rat1 or NIH3T3 cells, which expressed viral Ha-ras p21. The assay is performed essentially as described in DeClue, J.E. et al., Cancer Research 51:712-717, (1991). Cells in 10 cm dishes at 50-75% confluency are treated with the test compound or composition (final concentration of solvent, methanol or dimethyl sulfoxide, is 0.1%). After 4 hours at 37°C, the cells are labeled in 3 ml methionine-free DMEM supplemented with 10% regular DMEM, 2% fetal bovine serum and 400  $\mu$ Ci [<sup>35</sup>S]methionine (1000 Ci/mmol). After an additional 20 hours, the cells are lysed in 1 ml lysis buffer (1% NP40/20 mM HEPES, pH 7.5/5 mM MgCl<sub>2</sub>/1mM DTT/10 mg/ml aprotinin/2 mg/ml leupeptin/2 mg/ml antipain/0.5 mM PMSF) and the lysates cleared by centrifugation at 100,000 x g for 45 min. Aliquots of lysates containing equal numbers of acid-precipitable counts are brought to 1 ml with IP buffer (lysis buffer lacking DTT) and immunoprecipitated with the ras-specific monoclonal antibody Y13-259

(Furth, M.E. et al., J. Virol. 43:294-304, (1982)). Following a 2 hour antibody incubation at 4°C, 200 µl of a 25% suspension of protein A-Sepharose coated with rabbit anti rat IgG is added for 45 min. The immunoprecipitates are washed four times with IP buffer (20 mM HEPES, pH 7.5/1 mM EDTA/1% Triton X-100.0.5% deoxycholate/0.1%/SDS/0.1 M NaCl) boiled in SDS-PAGE sample buffer and loaded on 13% acrylamide gels. When the dye front reached the bottom, the gel is fixed, soaked in Enlightening, dried and autoradiographed. The intensities of the bands corresponding to farnesylated and nonfarnesylated ras proteins are compared to determine the percent inhibition of farnesyl transfer to protein.

### EXAMPLE 38

#### Cell-based *in vitro* growth inhibition assay

To determine the biological consequences of FPTase inhibition, the effect of the instant compositions and the compounds useful in the instant invention on the anchorage-independent growth of Rat1 cells transformed with either a *v-ras*, *v-raf*, or *v-mos* oncogene is tested. Cells transformed by v-Raf and v-Mos maybe included in the analysis to evaluate the specificity of instant compounds for Ras-induced cell transformation.

Rat 1 cells transformed with either *v-ras*, *v-raf*, or *v-mos* are seeded at a density of  $1 \times 10^4$  cells per plate (35 mm in diameter) in a 0.3% top agarose layer in medium A (Dulbecco's modified Eagle's medium supplemented with 10% fetal bovine serum) over a bottom agarose layer (0.6%). Both layers contain 0.1% methanol or an appropriate concentration of the test compound or composition (dissolved in methanol at 1000 times the final concentration used in the assay). The cells are fed twice weekly with 0.5 ml of medium A containing 0.1% methanol or the concentration of the instant compound. Photomicrographs are taken 16 days after the cultures are seeded and comparisons are made.

### EXAMPLE 39

#### Construction of SEAP reporter plasmid pDSE100

5 The SEAP reporter plasmid, pDSE100 was constructed by  
ligating a restriction fragment containing the SEAP coding sequence  
into the plasmid pCMV-RE-AKI. The SEAP gene is derived from the  
plasmid pSEAP2-Basic (Clontech, Palo Alto, CA). The plasmid pCMV-  
RE-AKI contains 5 sequential copies of the 'dyad symmetry response  
10 element' cloned upstream of a 'CAT-TATA' sequence derived from the  
cytomegalovirus immediate early promoter. The plasmid also contains  
a bovine growth hormone poly-A sequence.

The plasmid, pDSE100 was constructed as follows. A  
restriction fragment encoding the SEAP coding sequence was cut out of  
the plasmid pSEAP2-Basic using the restriction enzymes EcoR1 and  
15 HpaI. The ends of the linear DNA fragments were filled in with the  
Klenow fragment of E. coli DNA Polymerase I. The 'blunt ended' DNA  
containing the SEAP gene was isolated by electrophoresing the digest in  
an agarose gel and cutting out the 1694 base pair fragment. The vector  
plasmid pCMV-RE-AKI was linearized with the restriction enzyme Bgl-  
20 II and the ends filled in with Klenow DNA Polymerase I. The SEAP  
DNA fragment was blunt end ligated into the pCMV-RE-AKI vector and  
the ligation products were transformed into DH5-alpha E. coli cells  
(Gibco-BRL). Transformants were screened for the proper insert and  
then mapped for restriction fragment orientation. Properly oriented  
25 recombinant constructs were sequenced across the cloning junctions to  
verify the correct sequence. The resulting plasmid contains the SEAP  
coding sequence downstream of the DSE and CAT-TATA promoter  
elements and upstream of the BGH poly-A sequence.

#### 30 Alternative Construction of SEAP reporter plasmid, pDSE101

The SEAP repotrter plasmid, pDSE101 is also constructed by  
ligating a restriction fragment containing the SEAP coding sequence  
into the plasmid pCMV-RE-AKI. The SEAP gene is derived from  
plasmid pGEM7zf(-)/SEAP.

The plasmid pDSE101 was constructed as follows: A restriction fragment containing part of the SEAP gene coding sequence was cut out of the plasmid pGEM7zf(-)/SEAP using the restriction enzymes Apa I and KpnI. The ends of the linear DNA fragments were chewed back with the Klenow fragment of *E. coli* DNA Polymerase I. The "blunt ended" DNA containing the truncated SEAP gene was isolated by electrophoresing the digest in an agarose gel and cutting out the 1910 base pair fragment. This 1910 base pair fragment was ligated into the plasmid pCMV-RE-AKI which had been cut with Bgl-II and filled in with *E. coli* Klenow fragment DNA polymerase. Recombinant plasmids were screened for insert orientation and sequenced through the ligated junctions. The plasmid pCMV-RE-AKI is derived from plasmid pCMVIE-AKI-DHFR (Whang, Y., Silberklang, M., Morgan, A., Munshi, S., Lenny, A.B., Ellis, R.W., and Kieff, E. (1987) *J. Virol.*, 61, 1796-1807) by removing an EcoRI fragment containing the DHFR and Neomycin markers. Five copies of the *fos* promoter serum response element were inserted as described previously (Jones, R.E., Defeo-Jones, D., McAvoy, E.M., Vuocolo, G.A., Wegrzyn, R.J., Haskell, K.M. and Oliff, A. (1991) *Oncogene*, 6, 745-751) to create plasmid pCMV-RE-AKI.

The plasmid pGEM7zf(-)/SEAP was constructed as follows. The SEAP gene was PCR'd, in two segments from a human placenta cDNA library (Clontech) using the following oligos.

Sense strand N-terminal SEAP : 5'  
GAGAGGGAATTCGGGCCCTTCCTGCAT  
GCTGCTGCTGCTGCTGCTGCTGGGC 3' (SEQ.ID.NO.:69)

Antisense strand N-terminal SEAP: 5'  
GAGAGAGCTCGAGGTTAACCCGGGT  
GCGCGGCGTCGGTGGT 3' (SEQ.ID.NO.:70)

Sense strand C-terminal SEAP: 5'  
GAGAGAGTCTAGAGTTAACCCGTGGTCC  
CCGCGTTGCTTCCT 3' (SEQ.ID.NO.:71)

Antisense strand C-terminal SEAP: 5'  
GAAGAGGAAGCTTGGTACCGCCACTG  
GGCTGTAGGTGGTGGCT 3' (SEQ.ID.NO.:72)

5                   The N-terminal oligos (SEQ.ID.NO.: 4 and SEQ.ID.NO.: 5)  
were used to generate a 1560 bp N-terminal PCR product that contained  
EcoRI and HpaI restriction sites at the ends. The Antisense N-terminal  
oligo (SEQ.ID.NO.: 4) introduces an internal translation STOP codon  
within the SEAP gene along with the HpaI site. The C-terminal oligos  
10 (SEQ.ID.NO.: 5 and SEQ.ID.NO.: 6) were used to amplify a 412 bp C-  
terminal PCR product containing HpaI and HindIII restriction sites.  
The sense strand C-terminal oligo (SEQ.ID.NO.: 5) introduces the  
internal STOP codon as well as the HpaI site. Next, the N-terminal  
amplicon was digested with EcoRI and HpaI while the C-terminal  
15 amplicon was digested with HpaI and HindIII. The two fragments  
comprising each end of the SEAP gene were isolated by electrophoresing  
the digest in an agarose gel and isolating the 1560 and 412 base pair  
fragments. These two fragments were then co-ligated into the vector  
pGEM7zf(-) (Promega) which had been restriction digested with EcoRI  
20 and HindIII and isolated on an agarose gel. The resulting clone,  
pGEM7zf(-)/SEAP contains the coding sequence for the SEAP gene from  
amino acids.

#### Construction of a constitutively expressing SEAP plasmid pCMV-SEAP

25                   An expression plasmid constitutively expressing the SEAP  
protein was created by placing the sequence encoding a truncated SEAP  
gene downstream of the cytomegalovirus (CMV) IE-1 promoter. The  
expression plasmid also includes the CMV intron A region 5' to the  
SEAP gene as well as the 3' untranslated region of the bovine growth  
30 hormone gene 3' to the SEAP gene.

                  The plasmid pCMVIE-AKI-DHFR (Whang et al, 1987)  
containing the CMV immediate early promoter was cut with EcoRI  
generating two fragments. The vector fragment was isolated by agarose  
electrophoresis and religated. The resulting plasmid is named pCMV-  
35 AKI. Next, the cytomegalovirus intron A nucleotide sequence was

inserted downstream of the CMV IE1 promoter in pCMV-AKI. The intron A sequence was isolated from a genomic clone bank and sub-cloned into pBR322 to generate plasmid p16T-286. The intron A sequence was mutated at nucleotide 1856 (nucleotide numbering as in Chapman, B.S., Thayer, R.M., Vincent, K.A. and Haigwood, N.L., Nuc.Acids Res. 19, 3979-3986) to remove a SacI restriction site using site directed mutagenesis. The mutated intron A sequence was PCR'd from the plasmid p16T-287 using the following oligos.

10 Sense strand: 5' GGCAGAGCTCGTTTAGTGAACCGTCAG 3'  
(SEQ.ID.NO.: 73)

Antisense strand: 5' GAGAGATCTCAAGGACGGTGACTGCAG 3'  
(SEQ.ID.NO.: 74)

15

These two oligos generate a 991 base pair fragment with a SacI site incorporated by the sense oligo and a Bgl-II fragment incorporated by the antisense oligo. The PCR fragment is trimmed with SacI and Bgl-II and isolated on an agarose gel. The vector pCMV-AKI is cut with SacI and Bgl-II and the larger vector fragment isolated by agarose gel electrophoresis. The two gel isolated fragments are ligated at their respective SacI and Bgl-II sites to create plasmid pCMV-AKI-InA.

25 The DNA sequence encoding the truncated SEAP gene is inserted into the pCMV-AKI-InA plasmid at the Bgl-II site of the vector. The SEAP gene is cut out of plasmid pGEM7zf(-)/SEAP (described above) using EcoRI and HindIII. The fragment is filled in with Klenow DNA polymerase and the 1970 base pair fragment isolated from the vector fragment by agarose gel electrophoresis. The pCMV-AKI-InA vector is prepared by digesting with Bgl-II and filling in the ends with Klenow DNA polymerase. The final construct is generated by blunt end ligating the SEAP fragment into the pCMV-AKI-InA vector. Transformants were screened for the proper insert and then mapped for restriction fragment orientation. Properly oriented recombinant constructs were  
35 sequenced across the cloning junctions to verify the correct sequence.

The resulting plasmid, named pCMV-SEAP, contains a modified SEAP sequence downstream of the cytomegalovirus immediately early promoter IE-1 and intron A sequence and upstream of the bovine growth hormone poly-A sequence. The plasmid expresses SEAP in a  
 5 constitutive manner when transfected into mammalian cells.

Cloning of a Myristylated viral-H-ras expression plasmid

A DNA fragment containing viral-H-ras can be PCR'd from plasmid "H-1" (Ellis R. et al. J. Virol. 36, 408, 1980) or "HB-11 (deposited  
 10 in the ATCC under Budapest Treaty on August 27, 1997, and designated ATCC 209,218) using the following oligos.

Sense strand:

5'TCTCCTCGAGGCCACCATGGGGAGTAGCAAGAGCAAGCCTAA  
 15 GGACCCAGCCAGCGCCGGATGACAGAATACAAGCTTGTGGTG  
 G 3'. (SEQ.ID.NO.: 75)

Antisense:

5'CACATCTAGATCAGGACAGCACAGACTTGCAGC 3'.  
 20 (SEQ.ID.NO.: 76)

A sequence encoding the first 15 aminoacids of the v-src gene, containing a myristylation site, is incorporated into the sense strand oligo. The sense strand oligo also optimizes the 'Kozak'  
 25 translation initiation sequence immediately 5' to the ATG start site. To prevent prenylation at the viral-ras C-terminus, cysteine 186 would be mutated to a serine by substituting a G residue for a C residue in the C-terminal antisense oligo. The PCR primer oligos introduce an XhoI site at the 5' end and a XbaI site at the 3'end. The XhoI-XbaI fragment can  
 30 be ligated into the mammalian expression plasmid pCI (Promega) cut with XhoI and XbaI. This results in a plasmid in which the recombinant myr-viral-H-ras gene is constitutively transcribed from the CMV promoter of the pCI vector.

Cloning of a viral-H-ras-CVLL expression plasmid

A viral-H-ras clone with a C-terminal sequence encoding the amino acids CVLL can be cloned from the plasmid "H-1" (Ellis R. et al. J. Virol. 36, 408, 1980) or "HB-11 (deposited in the ATCC under Budapest Treaty on August 27, 1997, and designated ATCC 209,218) by PCR using the following oligos.

Sense strand:

5'TCTCCTCGAGGCCACCATGACAGAATACAAGCTTGTGGTGG-3'  
(SEQ.ID.NO.: 77)

Antisense strand:

5'CACTCTAGACTGGTGTCTCAGAGCAGCACACACTTGCAGC-3'  
(SEQ.ID.NO.: 78)

The sense strand oligo optimizes the 'Kozak' sequence and adds an XhoI site. The antisense strand mutates serine 189 to leucine and adds an XbaI site. The PCR fragment can be trimmed with XhoI and XbaI and ligated into the XhoI-XbaI cut vector pCI (Promega). This results in a plasmid in which the mutated viral-H-ras-CVLL gene is constitutively transcribed from the CMV promoter of the pCI vector.

Cloning of c-H-ras-Leu61 expression plasmid

The human c-H-ras gene can be PCR'd from a human cerebral cortex cDNA library (Clontech) using the following oligonucleotide primers.

Sense strand:

5'-GAGAGAATTTCGCCACCATGACGGAATATAAGCTGGTGG-3'  
(SEQ.ID.NO.: 79)

Antisense strand:

5'-GAGAGTCGACGCGTCAGGAGAGCACACACTTGC-3'  
(SEQ.ID.NO.: 80)

The primers will amplify a c-H-*ras* encoding DNA fragment with the primers contributing an optimized 'Kozak' translation start sequence, an EcoRI site at the N-terminus and a Sal I stite at the C-terminal end. After trimming the ends of the PCR product  
5 with EcoRI and Sal I, the c-H-*ras* fragment can be ligated into an EcoRI -Sal I cut mutagenesis vector pAlter-1 (Promega). Mutation of glutamine-61 to a leucine can be accomplished using the manufacturer's protocols and the following oligonucleotide:

10 5'-CCGCCGGCCTGGAGGAGTACAG-3' (SEQ.ID.NO.: 81)

After selection and sequencing for the correct nucleotide substitution, the mutated c-H-*ras*-Leu61 can be excised from the pAlter-1 vector, using EcoRI and Sal I, and be directly ligated into the vector pCI  
15 (Promega) which has been digested with EcoRI and Sal I. The new recombinant plasmid will constitutively transcribe c-H-*ras*-Leu61 from the CMV promoter of the pCI vector.

Cloning of a c-N-*ras*-Val-12 expression plasmid

20 The human c-N-*ras* gene can be PCR'd from a human cerebral cortex cDNA library (Clontech) using the following oligonucleotide primers.

Sense strand:

25 5'-GAGAGAATTCGCCACCATGACTGAGTACAAACTGGTGG-3'  
(SEQ.ID.NO.: 82)

Antisense strand:

30 5'-GAGAGTCGACTTGTTACATCACCACACATGGC-3' (SEQ.ID.NO.: 83)

The primers will amplify a c-N-*ras* encoding DNA fragment with the primers contributing an optimized 'Kozak' translation start sequence, an EcoRI site at the N-terminus and a Sal I  
35 stite at the C-terminal end. After trimming the ends of the PCR product

with EcoRI and Sal I, the c-N-ras fragment can be ligated into an EcoRI-Sal I cut mutagenesis vector pAlter-1 (Promega). Mutation of glycine-12 to a valine can be accomplished using the manufacturer's protocols and the following oligonucleotide:

5

5'-GTTGGAGCAGTTGGTGGTGGG-3' (SEQ.ID.NO.: 84)

After selection and sequencing for the correct nucleotide substitution, the mutated c-N-ras-Val-12 can be excised from the pAlter-1 vector, using EcoRI and Sal I, and be directly ligated into the vector pCI (Promega) which has been digested with EcoRI and Sal I. The new recombinant plasmid will constitutively transcribe c-N-ras-Val-12 from the CMV promoter of the pCI vector.

15 Cloning of a c-K-ras-Val-12 expression plasmid

The human c-K-ras gene can be PCR'd from a human cerebral cortex cDNA library (Clontech) using the following oligonucleotide primers.

20 Sense strand:

5'-GAGAGGTACCGCCACCATGACTGAATATAAACTTGTGG-3'  
(SEQ.ID.NO.: 85)

Antisense strand:

25 5'-CTCTGTGCGACGTATTTACATAATTACACACTTTGTC-3'  
(SEQ.ID.NO.: 86)

The primers will amplify a c-K-ras encoding DNA fragment with the primers contributing an optimized 'Kozak' translation start sequence, a KpnI site at the N-terminus and a Sal I site at the C-terminal end. After trimming the ends of the PCR product with Kpn I and Sal I, the c-K-ras fragment can be ligated into a KpnI-Sal I cut mutagenesis vector pAlter-1 (Promega). Mutation of cysteine-12 to a valine can be accomplished using the manufacturer's protocols and the following oligonucleotide:

35

5'-GTAGTTGGAGCTGTTGGCGTAGGC-3' (SEQ.ID.NO.:87)

After selection and sequencing for the correct nucleotide substitution, the mutated *c-K-ras*-Val-12 can be excised from the pAlter-1 vector, using KpnI and Sal I, and be directly ligated into the vector pCI (Promega) which has been digested with KpnI and Sal I. The new recombinant plasmid will constitutively transcribe *c-K-ras*-Val-12 from the CMV promoter of the pCI vector.

#### SEAP assay

Human C33A cells (human epithelial carcinoma - ATTC collection) are seeded in 10cm tissue culture plates in DMEM + 10% fetal calf serum + 1X Pen/Strep + 1X glutamine + 1X NEAA. Cells are grown at 37°C in a 5% CO<sub>2</sub> atmosphere until they reach 50 -80% of confluency.

The transient transfection is performed by the CaPO<sub>4</sub> method (Sambrook et al., 1989). Thus, expression plasmids for *H-ras*, *N-ras*, *K-ras*, *Myr-ras* or *H-ras*-CVLL are co-precipitated with the DSE-SEAP reporter construct. For 10cm plates 600μl of CaCl<sub>2</sub>-DNA solution is added dropwise while vortexing to 600μl of 2X HBS buffer to give 1.2ml of precipitate solution (see recipes below). This is allowed to sit at room temperature for 20 to 30 minutes. While the precipitate is forming, the media on the C33A cells is replaced with DMEM (minus phenol red; Gibco cat. # 31053-028)+ 0.5% charcoal stripped calf serum + 1X (Pen/Strep, Glutamine and nonessential aminoacids). The CaPO<sub>4</sub>-DNA precipitate is added dropwise to the cells and the plate rocked gently to distribute. DNA uptake is allowed to proceed for 5-6 hrs at 37°C under a 5% CO<sub>2</sub> atmosphere.

Following the DNA incubation period, the cells are washed with PBS and trypsinized with 1ml of 0.05% trypsin. The 1 ml of trypsinized cells is diluted into 10ml of phenol red free DMEM + 0.2% charcoal stripped calf serum + 1X (Pen/Strep, Glutamine and NEAA ). Transfected cells are plated in a 96 well microtiter plate (100μl/well) to which drug, diluted in media, has already been added in a volume of

100 $\mu$ l. The final volume per well is 200 $\mu$ l with each drug concentration repeated in triplicate over a range of half-log steps.

Incubation of cells and test compounds or compositions is for 36 hrs at 37°C under CO<sub>2</sub>. At the end of the incubation period, cells are examined microscopically for evidence of cell distress. Next, 100 $\mu$ l of media containing the secreted alkaline phosphatase is removed from each well and transferred to a microtube array for heat treatment at 65°C for 1 hr to inactivate endogenous alkaline phosphatases (but not the heat stable secreted phosphatase).

The heat treated media is assayed for alkaline phosphatase by a luminescence assay using the luminescence reagent CSPD® (Tropix, Bedford, Mass.). A volume of 50  $\mu$ l media is combined with 200  $\mu$ l of CSPD cocktail and incubated for 60 minutes at room temperature. Luminescence is monitored using an ML2200 microplate luminometer (Dynatech). Luminescence reflects the level of activation of the fos reporter construct stimulated by the transiently expressed protein.

#### DNA-CaPO<sub>4</sub> precipitate for 10cm. plate of cells

	Ras expression plasmid (1 $\mu$ g/ $\mu$ l)	10 $\mu$ l
20	DSE-SEAP Plasmid (1 $\mu$ g/ $\mu$ l)	2 $\mu$ l
	Sheared Calf Thymus DNA (1 $\mu$ g/ $\mu$ l)	8 $\mu$ l
	2M CaCl <sub>2</sub>	74 $\mu$ l
	dH <sub>2</sub> O	506 $\mu$ l

#### 25 2X HBS Buffer

	280mM NaCl
	10mM KCl
	1.5mM Na <sub>2</sub> HPO <sub>4</sub> 2H <sub>2</sub> O
	12mM dextrose
30	50mM HEPES
	Final pH = 7.05

#### Luminescence Buffer (26ml)

	Assay Buffer	20ml
35	Emerald Reagent™ (Tropix)	2.5ml

100mM homoarginine	2.5ml
CSPD Reagent® (Tropix)	1.0ml

Assay Buffer

- 5        Add 0.05M Na<sub>2</sub>CO<sub>3</sub> to 0.05M NaHCO<sub>3</sub> to obtain pH 9.5.  
      Make 1mM in MgCl<sub>2</sub>

EXAMPLE 40

- 10        The processing assays employed in this example and in  
      Example 41 are modifications of that described by DeClue et al [Cancer  
      Research 51, 712-717, 1991].

K4B-Ras processing inhibition assay

- 15        PSN-1 (human pancreatic carcinoma) are used for analysis  
      of protein processing. Subconfluent cells in 100 mm dishes are fed with  
      3.5 ml of media (methionine-free RPMI supplemented with 2% fetal  
      bovine serum or cysteine-free/methionine-free DMEM supplemented  
20        with 0.035 ml of 200 mM glutamine (Gibco), 2% fetal bovine serum,  
      respectively) containing the desired concentration of farnesyl-protein  
      transferase inhibitor, HMG-CoA reductase inhibitor, instant  
      combination composition or solvent alone. Test compounds or  
      compositions are prepared as 1000x concentrated solutions in DMSO to  
      yield a final solvent concentration of 0.1%. Following incubation at 37°C  
25        for two hours 204 µCi/ml [<sup>35</sup>S]Pro-Mix (Amersham, cell labeling grade)  
      is added.

- After introducing the label amino acid mixture, the cells  
      are incubated at 37°C for an additional period of time (typically 6 to 24  
      hours). The media is then removed and the cells are washed once with  
30        cold PBS. The cells are scraped into 1 ml of cold PBS, collected by  
      centrifugation (10,000 x g for 10 sec at room temperature), and lysed by  
      vortexing in 1 ml of lysis buffer (1% Nonidet P-40, 20 mM HEPES, pH 7.5,  
      150 mM NaCl, 1 mM EDTA, 0.5% deoxycholate, 0.1% SDS, 1 mM DTT, 10  
      µg/ml AEBSF, 10 µg/ml aprotinin, 2 µg/ml leupeptin and 2 µg/ml

antipain). The lysate is then centrifuged at 15,000 x g for 10 min at 4°C and the supernatant saved.

For immunoprecipitation of Ki4B-Ras, samples of lysate supernatant containing equal amounts of protein are utilized. Protein concentration is determined by the bradford method utilizing bovine serum albumin as a standard. The appropriate volume of lysate is brought to 1 ml with lysis buffer lacking DTT and 8 µg of the pan Ras monoclonal antibody, Y13-259, added. The protein/antibody mixture is incubated on ice at 4°C for 24 hours. The immune complex is collected on pansorbin (Calbiochem) coated with rabbit antiserum to rat IgG (Cappel) by tumbling at 4°C for 45 minutes. The pellet is washed 3 times with 1 ml of lysis buffer lacking DTT and protease inhibitors and resuspended in 100 µl elution buffer (10 mM Tris pH 7.4, 1% SDS). The Ras is eluted from the beads by heating at 95°C for 5 minutes, after which the beads are pelleted by brief centrifugation (15,000 x g for 30 sec. at room temperature).

The supernatant is added to 1 ml of Dilution Buffer (0.1% Triton X-100, 5 mM EDTA, 50 mM NaCl, 10 mM Tris pH 7.4) with 2 µg Kirsten-ras specific monoclonal antibody, c-K-ras Ab-1 (Calbiochem). The second protein/antibody mixture is incubated on ice at 4°C for 1-2 hours. The immune complex is collected on pansorbin (Calbiochem) coated with rabbit antiserum to rat IgG (Cappel) by tumbling at 4°C for 45 minutes. The pellet is washed 3 times with 1 ml of lysis buffer lacking DTT and protease inhibitors and resuspended in Laemmli sample buffer. The Ras is eluted from the beads by heating at 95°C for 5 minutes, after which the beads are pelleted by brief centrifugation. The supernatant is subjected to SDS-PAGE on a 12% acrylamide gel (bis-acrylamide:acrylamide, 1:100), and the Ras visualized by fluorography.

### 30 hDJ processing inhibition assay

PSN-1 cells are seeded in 24-well assay plates. For each compound or composition to be tested, the cells are treated with a minimum of seven concentrations in half-log steps. The final solvent

(DMSO) concentration is 0.1%. A vehicle-only control is included on each assay plate. The cells are treated for 24 hours at 37°C / 5% CO<sub>2</sub>.

5 The growth media is then aspirated and the samples are washed with PBS. The cells are lysed with SDS-PAGE sample buffer containing 5% 2-mercaptoethanol and heated to 95°C for 5 minutes. After cooling on ice for 10 minutes, a mixture of nucleases is added to reduce viscosity of the samples.

10 The plates are incubated on ice for another 10 minutes. The samples are loaded onto pre-cast 8% acrylamide gels and electrophoresed at 15 mA/gel for 3-4 hours. The samples are then transferred from the gels to PVDF membranes by Western blotting.

15 The membranes are blocked for at least 1 hour in buffer containing 2% nonfat dry milk. The membranes are then treated with a monoclonal antibody to HDJ-2 (Neomarkers Cat. # MS-225), washed, and treated with an alkaline phosphatase-conjugated secondary antibody. The membranes are then treated with a fluorescent detection reagent and scanned on a phosphorimager.

20 For each sample, the percent of total signal corresponding to the unprenylated species of HDJ (the slower-migrating species) is calculated by densitometry. Dose-response curves and IC<sub>50</sub> values are generated using 4-parameter curve fits in SigmaPlot software.

#### EXAMPLE 41

##### K4B-Ras processing inhibition assay

25

PSN-1 (human pancreatic carcinoma) cells are used for analysis of protein processing. Subconfluent cells in 150 mm dishes are fed with 20 ml of media (RPMI supplemented with 15% fetal bovine serum) containing the desired concentration of test composition, 30 compound, lovastatin or solvent alone. Cells treated with lovastatin (5-10 µM), a compound that blocks Ras processing in cells by inhibiting a rate-limiting step in the isoprenoid biosynthetic pathway, serve as a positive control. Test compounds and compositions are prepared as 1000x concentrated solutions in DMSO to yield a final solvent concentration of 0.1%.

- The cells are incubated at 37°C for 24 hours, the media is then removed and the cells are washed twice with cold PBS. The cells are scraped into 2 ml of cold PBS, collected by centrifugation (10,000 x g for 5 min at 4°C) and frozen at -70°C. Cells are lysed by thawing and
- 5 addition of lysis buffer (50 mM HEPES, pH 7.2, 50 mM NaCl, 1% CHAPS, 0.7 µg/ml aprotinin, 0.7 µg/ml leupeptin 300 µg/ml pefabloc, and 0.3 mM EDTA). The lysate is then centrifuged at 100,000 x g for 60 min at 4°C and the supernatant saved. The supernatant may be subjected to SDS-PAGE, HPLC analysis, and/or chemical cleavage techniques.
- 10 The lysate is applied to a HiTrap-SP (Pharmacia Biotech) column in buffer A (50 mM HEPES pH 7.2) and resolved by gradient in buffer A plus 1 M NaCl. Peak fractions containing Ki4B-Ras are pooled, diluted with an equal volume of water and immunoprecipitated with the pan Ras monoclonal antibody, Y13-259 linked to agarose or Kirsten-ras
- 15 specific monoclonal antibody, c-K-ras Ab-1 (Calbiochem). The protein/antibody mixture is incubated at 4°C for 12 hours. The immune complex is washed 3 times with PBS, followed by 3 times with water. The Ras is eluted from the beads by either high pH conditions (pH>10) or by heating at 95°C for 5 minutes, after which the beads are pelleted by
- 20 brief centrifugation. The supernatant may be subjected to SDS-PAGE, HPLC analysis, and/or chemical cleavage techniques.

#### EXAMPLE 42

##### Rap1 processing inhibition assay

25

##### Protocol A:

Cells are labeled, incubated and lysed as described in Example 41.

- For immunoprecipitation of Rap1, samples of lysate
- 30 supernatant containing equal amounts of protein are utilized. Protein concentration is determined by the bradford method utilizing bovine serum albumin as a standard. The appropriate volume of lysate is brought to 1 ml with lysis buffer lacking DTT and 2 µg of the Rap1 antibody, Rap1/Krev1 (121) (Santa Cruz Biotech), is added. The

protein/antibody mixture is incubated on ice at 4°C for 1 hour. The immune complex is collected on pansorbin (Calbiochem) by tumbling at 4°C for 45 minutes. The pellet is washed 3 times with 1 ml of lysis buffer lacking DTT and protease inhibitors and resuspended in 100 µl elution buffer (10 mM Tris pH 7.4, 1% SDS). The Rap1 is eluted from the beads by heating at 95°C for 5 minutes, after which the beads are pelleted by brief centrifugation (15,000 x g for 30 sec. at room temperature).

The supernatant is added to 1 ml of Dilution Buffer (0.1% Triton X-100, 5 mM EDTA, 50 mM NaCl, 10 mM Tris pH 7.4) with 2 mg Rap1 antibody, Rap1/Krev1 (121) (Santa Cruz Biotech). The second protein/antibody mixture is incubated on ice at 4°C for 1-2 hours. The immune complex is collected on pansorbin (Calbiochem) by tumbling at 4°C for 45 minutes. The pellet is washed 3 times with 1 ml of lysis buffer lacking DTT and protease inhibitors and resuspended in Laemmli sample buffer. The Rap1 is eluted from the beads by heating at 95°C for 5 minutes, after which the beads are pelleted by brief centrifugation. The supernatant is subjected to SDS-PAGE on a 12% acrylamide gel (bis-acrylamide:acrylamide, 1:100), and the Rap1 visualized by fluorography.

#### 20 Protocol B:

PSN-1 cells are passaged every 3-4 days in 10cm plates, splitting near-confluent plates 1:20 and 1:40. The day before the assay is set up,  $5 \times 10^6$  cells are plated on 15cm plates to ensure the same stage of confluency in each assay. The media for these cells is RPMI 1640 (Gibco), with 15% fetal bovine serum and 1x Pen/Strep antibiotic mix.

The day of the assay, cells are collected from the 15cm plates by trypsinization and diluted to 400,000 cells/ml in media. 0.5ml of these diluted cells are added to each well of 24-well plates, for a final cell number of 200,000 per well. The cells are then grown at 37°C overnight.

30 The compounds or compositionsto be assayed are diluted in DMSO in 1/2-log dilutions. The range of final concentrations to be assayed is generally 0.1-100µM. Four concentrations per compound is typical. The compounds are diluted so that each concentration is 1000x of

the final concentration (i.e., for a 10 $\mu$ M data point, a 10mM stock of the compound is needed).

2 $\mu$ L of each 1000x compound stock is diluted into 1ml media to produce a 2X stock of compound. A vehicle control solution (2 $\mu$ L DMSO to 1ml media), is utilized. 0.5 ml of the 2X stocks of compound are added to the cells.

After 24 hours, the media is aspirated from the assay plates. Each well is rinsed with 1ml PBS, and the PBS is aspirated. 180 $\mu$ L SDS-PAGE sample buffer (Novex) containing 5% 2-mercaptoethanol is added to each well. The plates are heated to 100°C for 5 minutes using a heat block containing an adapter for assay plates. The plates are placed on ice. After 10 minutes, 20 $\mu$ L of an RNase/DNase mix is added per well. This mix is 1mg/ml DNaseI (Worthington Enzymes), 0.25mg/ml Rnase A (Worthington Enzymes), 0.5M Tris-HCl pH8.0 and 50mM MgCl<sub>2</sub>. The plate is left on ice for 10 minutes. Samples are then either loaded on the gel, or stored at -70°C until use.

Each assay plate (usually 3 compounds, each in 4-point titrations, plus controls) requires one 15-well 14% Novex gel. 25 $\mu$ L of each sample is loaded onto the gel. The gel is run at 15mA for about 3.5 hours. It is important to run the gel far enough so that there will be adequate separation between 21kd (Rap1) and 29kd (Rab6).

The gels are then transferred to Novex pre-cut PVDF membranes for 1.5 hours at 30V (constant voltage). Immediately after transferring, the membranes are blocked overnight in 20ml Western blocking buffer (2% nonfat dry milk in Western wash buffer (PBS + 0.1% Tween-20). If blocked over the weekend, 0.02% sodium azide is added. The membranes are blocked at 4°C with slow rocking.

The blocking solution is discarded and 20ml fresh blocking solution containing the anti Rap1a antibody (Santa Cruz Biochemical SC1482) at 1:1000 (diluted in Western blocking buffer) and the anti Rab6 antibody (Santa Cruz Biochemical SC310) at 1:5000 (diluted in Western blocking buffer) are added. The membranes are incubated at room temperature for 1 hour with mild rocking. The blocking solution is then discarded and the membrane is washed 3 times with Western wash buffer for 15 minutes per wash. 20 ml blocking solution containing

1:1000 (diluted in Western blocking buffer) each of two alkaline phosphatase conjugated antibodies (Alkaline phosphatase conjugated Anti-goat IgG and Alkaline phosphatase conjugated anti-rabbit IgG [Santa Cruz Biochemical]) is then added. The membrane is incubated  
5 for one hour and washed 3x as above.

About 2ml per gel of the Amersham ECF detection reagent is placed on an overhead transparency (ECF) and the PVDF membranes are placed face-down onto the detection reagent. This is incubated for one minute, then the membrane is placed onto a fresh transparency  
10 sheet.

The developed transparency sheet is scanned on a phosphorimager and the Rap1a Minimum Inhibitory Concentration is determined from the lowest concentration of compound that produces a detectable Rap1a Western signal. The Rap1a antibody used recognizes  
15 only unprenylated/unprocessed Rap1a, so that the presence of a detectable Rap1a Western signal is indicative of inhibition of Rap1a prenylation.

The ability of the PSA conjugate compounds useful in the methods of the present invention of the present invention to be selectively  
20 cleaved by enzymatically active PSA and the selective cytotoxicity of those conjugate compounds can be demonstrated using the following assays.

#### Protocol C:

This protocol allows the determination of an  $EC_{50}$  for  
25 inhibition of processing of Rap1a. The assay is run as described in Protocol B with the following modifications. 20  $\mu$ l of sample is run on pre-cast 10-20% gradient acrylamide mini gels (Novex Inc.) at 15 mA/gel for 2.5-3 hours. Prenylated and unprenylated forms of Rap1a are detected by blotting with a polyclonal antibody (Rap1/Krev-1 Ab#121;  
30 Santa Cruz Research Products #sc-65), followed by an alkaline phosphatase-conjugated anti-rabbit IgG antibody. The percentage of unprenylated Rap1a relative to the total amount of Rap1a is determined by peak integration using Imagequant® software (Molecular Dynamics). Unprenylated Rap1a is distinguished from prenylated protein by virtue

of the greater apparent molecular weight of the prenylated protein. Dose-response curves and EC<sub>50</sub> values are generated using 4-parameter curve fits in SigmaPlot software.

5

#### EXAMPLE 43

##### Assessment of the Recognition of Oligopeptide-Cytotoxic Drug Conjugates by Free PSA

---

10 The conjugates prepared as described in Examples 28-34 are individually dissolved in PSA digestion buffer (50 mM tris(hydroxymethyl)-aminomethane pH7.4, 140 mM NaCl) and the solution added to PSA at a molar ration of 100 to 1. Alternatively, the PSA digestion buffer utilized is 50 mM tris(hydroxymethyl)-aminomethane pH7.4, 140 mM NaCl. The reaction is quenched after  
15 various reaction times by the addition of trifluoroacetic acid (TFA) to a final 1% (volume/volume). Alternatively the reaction is quenched with 10mM ZnCl<sub>2</sub>. The quenched reaction is analyzed by HPLC on a reversed-phase C18 column using an aqueous 0.1%TFA/acetonitrile gradient. The amount of time (in minutes) required for 50% cleavage of  
20 the noted oligopeptide-cytotoxic agent conjugates with enzymatically active free PSA were then calculated.

#### EXAMPLE 44

##### In vitro Assay of Cytotoxicity of Peptidyl Derivatives of Doxorubicin:

25

The cytotoxicities of the cleaveable oligopeptide-doxorubicin conjugates, prepared as described in Examples 25-27, against a line of cells which is known to be killed by unmodified doxorubicin are assessed with an Alamar Blue assay. Specifically, cell cultures of LNCap  
30 prostate tumor cells (which express enzymatically active PSA) or DuPRO cells in 96 well plates are diluted with medium (Dulbecco's Minimum Essential Medium- $\alpha$  [MEM- $\alpha$ ]) containing various concentrations of a given conjugate (final plate well volume of 200 $\mu$ l). The cells are incubated for 3 days at 37°C, 20 $\mu$ l of Alamar Blue is added

to the assay well. The cells are further incubated and the assay plates are read on a EL-310 ELISA reader at the dual wavelengths of 570 and 600 nm at 4 and 7 hours after addition of Alamar Blue. Relative percentage viability at the various concentration of conjugate tested is then calculated versus control (no conjugate) cultures.

#### EXAMPLE 45

##### *In vitro Assay of Cytotoxicity of Peptidyl Derivatives of Vinca Drugs*

The cytotoxicities of the cleaveable oligopeptide-vinca drug conjugates, prepared as described in Examples 28-34, against a line of cells which is known to be killed by unmodified vinca drug was assessed with an Alamar Blue assay. Specifically, cell cultures of LNCap prostate tumor cells, Colo320DM cells (designated C320) or T47D cells in 96 well plates are diluted with medium containing various concentrations of a given conjugate (final plate well volume of 200 $\mu$ l). The Colo320DM cells, which do not express free PSA, are used as a control cell line to determine non-mechanism based toxicity. The cells are incubated for 3 days at 37°C, 20 $\mu$ l of Alamar Blue is added to the assay well. The cells are further incubated and the assay plates are read on a EL-310 ELISA reader at the dual wavelengths of 570 and 600 nm at 4 and 7 hours after addition of Alamar Blue. Relative percentage viability at the various concentration of conjugate tested is then calculated versus control (no conjugate) cultures and an EC<sub>50</sub> was determined.

#### EXAMPLE 46

##### *In vivo Efficacy of Peptidyl -Cytotoxic Agent Conjugates*

LNCaP.FGC or DuPRO-1 cells are trypsinized, resuspended in the growth medium and centrifuged for 6 mins. at 200xg. The cells are resuspended in serum-free  $\alpha$ -MEM and counted. The appropriate volume of this solution containing the desired number of cells is then transferred to a conical centrifuge tube, centrifuged as before and resuspended in the appropriate volume of a cold 1:1 mixture of  $\alpha$ -MEM-

Matrigel. The suspension is kept on ice until the animals are inoculated.

5 Harlan Sprague Dawley male nude mice (10-12 weeks old) are restrained without anesthesia and are inoculated with 0.5 mL of cell suspension on the left flank by subcutaneous injection using a 22G needle. Mice are either given approximately  $5 \times 10^5$  DuPRO cells or  $1.5 \times 10^7$  LNCaP.FGC cells.

10 Following inoculation with the tumor cells the mice are treated under one of two protocols:

Protocol A:

15 One day after cell inoculation the animals are dosed with a 0.1-0.5 mL volume of test conjugate, vinca drug or vehicle control (sterile water). Dosages of the conjugate and vinca drug are initially the maximum non-lethal amount, but may be subsequently titrated lower. Identical doses are administered at 24 hour intervals for 5 days. After 10 days, blood samples are removed from the mice and the serum level of PSA is determined. Similar serum PSA levels are determined at 5-10 day intervals. At the end of 5.5 weeks the mice are sacrificed and weights of any tumors present are measured and serum PSA again determined. The animals' weights are determined at the beginning and end of the assay.

Protocol B:

25 Ten days after cell inoculation, blood samples are removed from the animals and serum levels of PSA are determined. Animals are then grouped according to their PSA serum levels. At 14-15 days after cell inoculation, the animals are dosed with a 0.1-0.5 mL volume of test conjugate, vinca drug or vehicle control (sterile water). Dosages of the conjugate and vinca drug are initially the maximum non-lethal amount, but may be subsequently titrated lower. Identical doses are administered at 24 hour intervals for 5 days. Serum PSA levels are determined at 5-10 day intervals. At the end of 5.5 weeks the mice are sacrificed, weights of any tumors present are measured and serum PSA

again determined. The animals' weights are determined at the beginning and end of the assay.

#### EXAMPLE 47

##### 5    In vivo Efficacy of Administration of a Combination of a PSA Conjugate and a Prenyl Protein Transferase Inhibitor

Male nude mice (4 groups of 15) were injected subcutaneously with  $1.5 \times 10^7$  LNCaP.FGC cells (available from the American Type Culture Collection, ATCC No. CRL-1740; see also J.S. Horoszewicz et al. *Cancer Res.*, 43:1809-1818 (1983)) in 80% Matrigel.

Compound A, prepared as described in Example 2 (1.8 g) was dissolved in 4.4 mL 50% aqueous DMSO; filtered through a Millipore Steriflip™ filter unit (0.22  $\mu$ m membrane) and stored at room temperature. ALZET® micro-osmotic pumps (model 1007D, mean pumping rate 0.5  $\mu$ L/hr, mean fill volume 98.1  $\mu$ L) were filled with either the solution of Compound A or vehicle (50% aqueous DMSO), placed in warm isotonic saline and kept in a 37°C waterbath until used.

On the forth day after the injection of the LNCaP.FGC cells, the mice were anesthetized and the pumps implanted subdermally as follows:

- Group A: Pump containing Compound A solution
- Group B: Pump containing vehicle
- Group C: Pump containing Compound A solution
- Group D: Pump containing vehicle

48 Hours after the implantation of the osmotic pumps, three mice from each group were bled from the tail vein to assess serum levels of Compound A. After the levels of Compound A were assessed, 0.20 mL of a solution of Compound B, prepared as described in Example 26 (37.1 mg dissolved in 34.1 mL D5W + 80  $\mu$ L 7.5% sodium bicarbonate) was administered to Groups A and B. Vehicle (0.20 mL) was administered to Groups C and D.

Four additional doses (one/day) of Compound B solution or vehicle were administered to the respective Groups over four days. The mice were then maintained for 22 days.

At the end of 22 days after the last injection of Compound B solution or vehicle the mice were bled from the tail vein and the plasma PSA level was measured using a Tandem®-E PSA ImmunoEnzyMetri Assay kit (Hybritech). The mice were then sacrificed, weighed, tumors excised and weighed. The results are shown in Figures 1 and 2.

#### 10 EXAMPLE 48

In vitro determination of proteolytic cleavage of conjugates by endogenous non-PSA proteases

##### Step A: Preparation of proteolytic tissue extracts

15 All procedures are carried out at 4°C. Appropriate animals are sacrificed and the relevant tissues are isolated and stored in liquid nitrogen. The frozen tissue is pulverized using a mortar and pestle and the pulverized tissue is transferred to a Potter-Elvehjem homogenizer and 2 volumes of Buffer A (50 mM Tris containing 1.15% KCl, pH 7.5) are  
20 added. The tissue is then disrupted with 20 strokes using first a loose fitting and then a tight fitting pestle. The homogenate is centrifuged at 10,000 x g in a swinging bucket rotor (HB4-5), the pellet is discarded and the re-supernatant centrifuged at 100,000 x g (Ti 70). The supernatant (cytosol) is saved.

25 The pellet is resuspended in Buffer B (10 mM EDTA containing 1.15% KCl, pH 7.5) using the same volume used in step as used above with Buffer A. The suspension is homogenized in a dounce homogenizer and the solution centrifuged at 100,000x g. The supernatant is discarded and the pellet resuspended in Buffer C (10 mM  
30 potassium phosphate buffer containing 0.25 M sucrose, pH 7.4), using 1/2 the volume used above, and homogenized with a dounce homogenizer.

Protein content of the two solutions (cytosol and membrane) is determined using the Bradford assay. Assay aliquots are then removed and frozen in liquid N<sub>2</sub>. The aliquots are stored at -70°C.

Step B: Proteolytic cleavage assay

For each time point, 20 microgram of peptide-vinca drug conjugate and 150 micrograms of tissue protein, prepared as described  
5 in Step A and as determined by Bradford in reaction buffer are placed in solution of final volume of 200 microliters in buffer (50 mM TRIS, 140 mM NaCl, pH 7.2). Assay reactions are run for 0, 30, 60, 120, and 180 minutes and are then quenched with 9 microliters of 0.1 M ZnCl<sub>2</sub> and immediately placed in boiling water for 90 seconds. Reaction products  
10 are analyzed by HPLC using a VYDAC C18 15 cm column in water / acetonitrile (5% to 50% acetonitrile over 30 minutes).

WHAT IS CLAIMED IS:

1. A method for achieving a therapeutic effect in a mammal in need thereof which comprises administering to said mammal amounts  
5 of at least one inhibitor of prenyl-protein transferase and at least one PSA conjugate.

2. The method according to Claim 1 wherein an amount of a prenyl-protein transferase inhibitor and an amount of an PSA conjugate  
10 are administered consecutively.

3. The method according to Claim 1 wherein an amount of a prenyl-protein transferase inhibitor and an amount of an PSA conjugate are administered simultaneously.  
15

4. The method according to Claim 1 wherein the therapeutic effect is treatment of cancer.

5. The method according to Claim 4 wherein the therapeutic effect is selected from inhibition of cancerous tumor growth and regression of cancerous tumors.  
20

6. The method according to Claim 4 wherein the cancer is a cancer related to cells that express enzymatically active PSA.  
25

7. The method according to Claim 4 wherein the cancer is prostate cancer.

8. The method according to Claim 1 wherein the PSA conjugate is selected from:  
30

a) a compound represented by the formula IX:

5 wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen;

10

$X_L$  is absent or is an amino acid selected from:

- a) phenylalanine,
- b) leucine,
- c) valine,
- 15 d) isoleucine,
- e) (2-naphthyl)alanine,
- f) cyclohexylalanine,
- g) diphenylalanine,
- h) norvaline, and
- 20 j) norleucine;

R is hydrogen or  $-(C=O)R^1$ ; and

$R^1$  is C<sub>1</sub>-C<sub>6</sub>-alkyl or aryl,

or the pharmaceutically acceptable salt thereof;

5 b) a compound represented by the formula X:

X

10 wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen;

15

X<sub>L</sub> is absent or is an amino acid selected from:

- a) phenylalanine,
- b) leucine,
- c) valine,
- 20 d) isoleucine,
- e) (2-naphthyl)alanine,

- f) cyclohexylalanine,
- g) diphenylalanine,
- h) norvaline, and
- j) norleucine; or

5

$X_L$  is  $-\text{NH}-(\text{CH}_2)_n-\text{NH}-$

R is hydrogen or  $-(\text{C}=\text{O})\text{R}^1$ ;

10  $\text{R}^1$  is  $\text{C}_1$ - $\text{C}_6$ -alkyl or aryl;

$\text{R}^{19}$  is hydrogen or acetyl; and

n is 1, 2, 3, 4 or 5,

15

or the pharmaceutically acceptable salt thereof;

c) a compound represented by the formula XI:

20

wherein:

oligopeptide is an oligopeptide which is selectively recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, wherein the oligopeptide comprises a cyclic amino acid of the formula:

and wherein

the C-terminus carbonyl is covalently bound to the amine of doxorubicin;

R is selected from

- a) hydrogen,
- b)  $-(C=O)R^{1a}$ ,
- c)

d)

e)

5  $\text{R}^1$  and  $\text{R}^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

$\text{R}^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

10  $\text{R}^5$  is selected from HO- and C<sub>1</sub>-C<sub>6</sub> alkoxy;

$\text{R}^6$  is selected from hydrogen, halogen, C<sub>1</sub>-C<sub>6</sub> alkyl, HO- and C<sub>1</sub>-C<sub>6</sub> alkoxy; and

n is 1, 2, 3 or 4;

15 p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

r is an integer between 1 and 10; and

t is 3 or 4;

20 or a pharmaceutically acceptable salt thereof;

d) a compound represented by the formula X:

5 wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, and the oligopeptide comprises a cyclic amino acid of the formula:

10

XL is -NH-(CH<sub>2</sub>)<sub>u</sub>-NH-

R is selected from

- a) hydrogen,
- b)  $-(C=O)R^{1a}$ ,
- c)

5

- d)

- e)

10

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

15  $R^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

$R^{19}$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

- 20 n is 1, 2, 3 or 4;
- p is zero or an integer between 1 and 100;
- q is 0 or 1, provided that if p is zero, q is 1;
- r is 1, 2 or 3;
- t is 3 or 4;
- 25 u is 1, 2, 3, 4 or 5,

or the pharmaceutically acceptable salt thereof;

e) a compound represented by the formula XI:

5

wherein:

oligopeptide is an oligopeptide which is selectively recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen, and wherein the C-terminus carbonyl is covalently bound to the amine of doxorubicin and the N-terminus amine is covalently bound to the carbonyl of the blocking group;

10

R is selected from

15

a)

b)

R<sup>1</sup> and R<sup>2</sup> are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl,  
 5 C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

10

or the pharmaceutically acceptable salt thereof;

f) a compound represented by the formula XIV:

15

wherein:

oligopeptide is an oligopeptide which is specifically recognized by  
 the free prostate specific antigen (PSA) and is capable of being  
 20 proteolytically cleaved by the enzymatic activity of the free prostate  
 specific antigen;

$X_L$  is  $-\text{NH}-(\text{CH}_2)_r-\text{NH}-$

R is selected from

5

a)

b)

10

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

15

$R^{19}$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

20

r is 1, 2, 3, 4 or 5;

or the pharmaceutically acceptable salt thereof;

g) a compound represented by the formula XV:

5 wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate specific antigen,

10

X<sub>L</sub> is -NH-(CH<sub>2</sub>)<sub>u</sub>-W-(CH<sub>2</sub>)<sub>u</sub>-NH-

R is selected from

- 15 a) hydrogen,  
b) -(C=O)R<sup>1a</sup>,  
c)

d)

5

e)

f) ethoxysquarate, and

g) cotininyll;

10

$R^1$  and  $R^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

15

$R^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated C<sub>3</sub>-C<sub>8</sub>-cycloalkyl, polyhydroxylated C<sub>3</sub>-C<sub>8</sub>-cycloalkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

$R^9$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

20

W is selected from cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.2]octanyl;

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

25

q is 0 or 1, provided that if p is zero, q is 1;

r is 1, 2 or 3;

t is 3 or 4;

u is 0, 1, 2 or 3;

30

or the pharmaceutically acceptable salt thereof; and

h) a compound represented by the formula XVI:

5

wherein:

oligopeptide is an oligopeptide which is specifically recognized by the free prostate specific antigen (PSA) and is capable of being proteolytically cleaved by the enzymatic activity of the free prostate

10 specific antigen,

X<sub>L</sub> is selected from: a bond, -C(O)-(CH<sub>2</sub>)<sub>u</sub>-W-(CH<sub>2</sub>)<sub>u</sub>-O- and -C(O)-(CH<sub>2</sub>)<sub>u</sub>-W-(CH<sub>2</sub>)<sub>u</sub>-NH-;

15 R is selected from

- a) hydrogen,
- b) -(C=O)R<sup>1a</sup>,
- c)

d)

e)

5

f) ethoxysquarate, and

g) cotininylnyl;

- 10  $\text{R}^1$  and  $\text{R}^2$  are independently selected from: hydrogen, OH, C<sub>1</sub>-C<sub>6</sub> alkyl, C<sub>1</sub>-C<sub>6</sub> alkoxy, C<sub>1</sub>-C<sub>6</sub> aralkyl and aryl;

$\text{R}^{1a}$  is C<sub>1</sub>-C<sub>6</sub>-alkyl, hydroxylated C<sub>3</sub>-C<sub>8</sub>-cycloalkyl, polyhydroxylated C<sub>3</sub>-C<sub>8</sub>-cycloalkyl, hydroxylated aryl, polyhydroxylated aryl or aryl;

15

$\text{R}^9$  is hydrogen, (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO, or chlorosubstituted (C<sub>1</sub>-C<sub>3</sub> alkyl)-CO;

W is selected from a branched or straight chain C<sub>1</sub>-C<sub>6</sub>-alkyl, cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.2]octanyl;

20

n is 1, 2, 3 or 4;

p is zero or an integer between 1 and 100;

q is 0 or 1, provided that if p is zero, q is 1;

r is 1, 2 or 3;

25 t is 3 or 4;

u is 0, 1, 2 or 3,

or the pharmaceutically acceptable salt or optical isomer thereof.

9. The method according to Claim 8 wherein the PSA conjugate is selected from:

i)

5

wherein X is:

- |  |                   |

5 wherein X is

5 or a pharmaceutically acceptable salt or optical isomer thereof.

10. The method according to Claim 1 wherein the inhibitor of prenyl-protein transferase is a selective inhibitor of farnesyl-protein transferase.

10

11. The method according to Claim 1 wherein the inhibitor of prenyl-protein transferase is a dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I.

15

12. The method according to Claim 11 wherein the dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I is a Class II inhibitor.

13. The method according to Claim 11 wherein the dual inhibitor of farnesyl-protein transferase and geranylgeranyl-protein transferase type I is a Class III inhibitor.

5 14. The method according to Claim 1 wherein the inhibitor of prenyl-protein transferase is selected from:

2(S)-Butyl-1-(2,3-diaminoprop-1-yl)-1-(1-naphthoyl)piperazine;

10 1-(3-Amino-2-(2-naphthylmethylamino)prop-1-yl)-2(S)-butyl-4-(1-naphthoyl)piperazine;

2(S)-Butyl-1-{5-[1-(2-naphthylmethyl)]-4,5-dihydroimidazol)methyl-4-(1-naphthoyl)piperazine;

15 1-[5-(1-Benzylimidazol)methyl]-2(S)-butyl-4-(1-naphthoyl)piperazine;

1-{5-[1-(4-nitrobenzyl)]imidazolymethyl}-2(S)-butyl-4-(1-naphthoyl)piperazine;

20 1-(3-Acetamidomethylthio-2(R)-aminoprop-1-yl)-2(S)-butyl-4-(1-naphthoyl)piperazine;

2(S)-Butyl-1-[2-(1-imidazolyl)ethyl]sulfonyl-4-(1-naphthoyl)piperazine;

25 2(R)-Butyl-1-imidazolyl-4-methyl-4-(1-naphthoyl)piperazine;

2(S)-Butyl-4-(1-naphthoyl)-1-(3-pyridylmethyl)piperazine;

30 1-2(S)-butyl-(2(R)-(4-nitrobenzyl)amino-3-hydroxypropyl)-4-(1-naphthoyl)piperazine;

1-(2(R)-Amino-3-hydroxyheptadecyl)-2(S)-butyl-4-(1-naphthoyl)-piperazine;

35

- 2(S)-Benzyl-1-imidazolyl-4-methyl-4-(1-naphthoyl)piperazine;
- 1-(2(R)-Amino-3-(3-benzylthio)propyl)-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 5 1-(2(R)-Amino-3-[3-(4-nitrobenzylthio)propyl])-2(S)-butyl-4-(1-naphthoyl)piperazine;
- 2(S)-Butyl-1-[(4-imidazolyl)ethyl]-4-(1-naphthoyl)piperazine;

1-[N-(1-(4-cyanobenzyl)-5-imidazolylmethyl)-N-(4-cyanobenzyl)amino]-4-(phenoxy)benzene

- 25 or a pharmaceutically acceptable salt or optical isomer thereof.

16. A pharmaceutical composition for achieving a therapeutic effect in a mammal in need thereof which comprises amounts of at least one inhibitor of prenyl-protein transferase and at least one PSA  
30 conjugate.

17. The pharmaceutical composition according to Claim 16 comprising an amount of a prenyl-protein transferase inhibitor and an amount of a PSA conjugate.

35

18. The pharmaceutical composition according to Claim 16 wherein the therapeutic effect is treatment of cancer.

5 19. The pharmaceutical composition according to Claim 16 wherein the therapeutic effect is selected from inhibition of cancerous tumor growth and the regression of cancerous tumors.

10 20. The method according to Claim 14 wherein the cancer is a cancer related to cells that express enzymatically active PSA.

21. The method according to Claim 20 wherein the cancer is prostate cancer.

15 22. A method of preparing a pharmaceutical composition for achieving a therapeutic effect in a mammal in need thereof which comprises mixing amounts of at least one inhibitor of prenyl-protein transferase and at least one PSA conjugate.

20 23. The method of preparing a pharmaceutical composition according to Claim 22 comprising mixing an amount of a prenyl-protein transferase inhibitor and an amount of an PSA conjugate.

25 24. A method of treating cancer in a mammal in need thereof which comprises administering to said mammal amounts of at least one inhibitor of prenyl-protein transferase and at least one PSA conjugate and applying to the mammal radiation therapy.

30 25. The method according to Claim 24 wherein an amount of a prenyl-protein transferase inhibitor and an amount of a PSA conjugate are administered simultaneously.

35 26. The method according to Claim 24 wherein an amount of a prenyl-protein transferase inhibitor and an amount of an PSA conjugate are administered consecutively.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US00/08762

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) :C07K 5/09; A61K 38/00, 31/495, 31/55

US CL :Please See Extra Sheet.

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 530/322, 324, 326, 328, 329; 514/12, 13, 14, 15, 16, 17, 218, 252, 255

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

USPT

search terms: doxorubicin, prostate specific antigen, farnesyl, geranyl, prenyl, piperazine, inhibit

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5,599,686 A (DEFEO-JONES et al.) 04 February 1997, see entire document.	1-26
Y	US 5,736,539 A (GRAHAM et al.) 07 April 1998, see entire document.	1-26
Y	US 5,856,326 A (ANTHONY et al.) 05 January 1999, see entire document.	1-26
Y	US 5,859,015 A (GRAHAM et al.) 12 January 1999, see entire document.	1-26
Y	US 5,866,679 A (DEFEO-JONES et al.) 02 February 1999, see entire document.	1-26

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*E* earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*A* document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means	
*P* document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/08762

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:  
1-26, A & E

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/08762

## A. CLASSIFICATION OF SUBJECT MATTER:

US CL :

530/322, 324, 326, 328, 329; 514/12, 13, 14, 15, 16, 17, 218, 252, 255

## BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

For the purposes of this lack of unity the following definitions of identifiable compounds are made:

- A = compounds of claim 8 (a) & (e)
- B = compounds of claim 8 (b) & (f)
- C = compounds of claim 8 (c) & (g)
- D = compounds of claim 8 (d) & (h)
- E = compounds of claim 14, piperazines
- F = compounds of claim 14, piperazinones
- G = compounds of claim 14, benzonitriles
- H = compounds of claim 14, carbonitriles
- I = compounds of claim 14, (phenoxy)benzenes
- J = compounds of claim 14, (phenyl)-ureas
- K = compounds of claim 14, triazacycloicosinones
- L = compounds of claim 14, phenyl-benzamides
- M = compounds of claim 14, benzenesulfonamides
- N = compounds of claim 14, nicotinamides
- O = compounds of claim 14, imidazoles
- P = compounds of claim 14, imidazolyl-methyl esters
- Q = compounds of claim 14, azepanones
- R = compounds of claim 14, acetamides

Group I, claims 1-26, drawn to compositions and methods of use of A and E.  
Group II, claims 1-26, drawn to compositions and methods of use of A and F.  
Group III, claims 1-26, drawn to compositions and methods of use of A and G.  
Group IV, claims 1-26, drawn to compositions and methods of use of A and H.  
Group V, claims 1-26, drawn to compositions and methods of use of A and I.  
Group VI, claims 1-26, drawn to compositions and methods of use of A and J.  
Group VII, claims 1-26, drawn to compositions and methods of use of A and K.  
Group VIII, claims 1-26, drawn to compositions and methods of use of A and L.  
Group IX, claims 1-26, drawn to compositions and methods of use of A and M.  
Group X, claims 1-26, drawn to compositions and methods of use of A and N.  
Group XI, claims 1-26, drawn to compositions and methods of use of A and O.  
Group XII, claims 1-26, drawn to compositions and methods of use of A and P.  
Group XIII, claims 1-26, drawn to compositions and methods of use of A and Q.  
Group XIV, claims 1-26, drawn to compositions and methods of use of A and R.

Group XV, claims 1-26, drawn to compositions and methods of use of B and E.  
Group XVI, claims 1-26, drawn to compositions and methods of use of B and F.  
Group XVII, claims 1-26, drawn to compositions and methods of use of B and G.  
Group XVIII, claims 1-26, drawn to compositions and methods of use of B and H.  
Group XIX, claims 1-26, drawn to compositions and methods of use of B and I.  
Group XX, claims 1-26, drawn to compositions and methods of use of B and J.  
Group XXI, claims 1-26, drawn to compositions and methods of use of B and K.  
Group XXII, claims 1-26, drawn to compositions and methods of use of B and L.  
Group XXIII, claims 1-26, drawn to compositions and methods of use of B and M.  
Group XXIV, claims 1-26, drawn to compositions and methods of use of B and N.  
Group XXV, claims 1-26, drawn to compositions and methods of use of B and O.  
Group XXVI, claims 1-26, drawn to compositions and methods of use of B and P.  
Group XXVII, claims 1-26, drawn to compositions and methods of use of B and Q.  
Group XXVIII, claims 1-26, drawn to compositions and methods of use of B and R.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US00/08762

Group XXIX, claims 1-26, drawn to compositions and methods of use of C and E.  
Group XXX, claims 1-26, drawn to compositions and methods of use of C and F.  
Group XXXI, claims 1-26, drawn to compositions and methods of use of C and G.  
Group XXXII, claims 1-26, drawn to compositions and methods of use of C and H.  
Group XXXIII, claims 1-26, drawn to compositions and methods of use of C and I.  
Group XXXIV, claims 1-26, drawn to compositions and methods of use of C and J.  
Group XXXV, claims 1-26, drawn to compositions and methods of use of C and K.  
Group XXXVI, claims 1-26, drawn to compositions and methods of use of C and L.  
Group XXXVII, claims 1-26, drawn to compositions and methods of use of C and M.  
Group XXXVIII, claims 1-26, drawn to compositions and methods of use of C and N.  
Group XXXIX, claims 1-26, drawn to compositions and methods of use of C and O.  
Group XXXX, claims 1-26, drawn to compositions and methods of use of C and P.  
Group XXXXI, claims 1-26, drawn to compositions and methods of use of C and Q.  
Group XXXXII, claims 1-26, drawn to compositions and methods of use of C and R.

Group XXXXIII, claims 1-26, drawn to compositions and methods of use of D and E.  
Group XXXXIV, claims 1-26, drawn to compositions and methods of use of D and F.  
Group XXXXV, claims 1-26, drawn to compositions and methods of use of D and G.  
Group XXXXVI, claims 1-26, drawn to compositions and methods of use of D and H.  
Group XXXXVII, claims 1-26, drawn to compositions and methods of use of D and I.  
Group XXXXVIII, claims 1-26, drawn to compositions and methods of use of D and J.  
Group XXXXIX, claims 1-26, drawn to compositions and methods of use of D and K.  
Group XXXXX, claims 1-26, drawn to compositions and methods of use of D and L.  
Group XXXXXI, claims 1-26, drawn to compositions and methods of use of D and M.  
Group XXXXXII, claims 1-26, drawn to compositions and methods of use of D and N.  
Group XXXXXIII, claims 1-26, drawn to compositions and methods of use of D and O.  
Group XXXXXIV, claims 1-26, drawn to compositions and methods of use of D and P.  
Group XXXXXV, claims 1-26, drawn to compositions and methods of use of D and Q.  
Group XXXXXVI, claims 1-26, drawn to compositions and methods of use of D and R.

The inventions listed as Groups I-XXXXXXVI do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

Each of the compounds groups, A-D, and E-R are functionally and structurally distinct each from each other. There is no relationship disclosed that relates the cytotoxic activity of the compounds A-D to the same target and function. There is no structural feature in common between the compounds of E-R which has been identified in the disclosure which can be related to their activity as a Class I (farnesyl but not geranylgeranyl inhibiting), Class II (dual, inhibiting farnesyl greater than geranylgeranyl) or Class III (dual, inhibiting geranylgeranyl greater than farnesyl) prenyl transferase inhibitor. As a consequence, there is no special technical feature linking the compounds of either A-D or E-R. Accordingly, every permutation of the combination of these two groups compounds corresponds to a separate composition and method of use.

Since all of the claims are generic to all of the inventions Groups, all of the claims will be considered insofar as they read on Groups for which the search has been paid.
